CAS

THE CERN ACCELERATOR SCHOOL

Overview

- First hour:
  - Introduction
  - Overview of measurement instruments
    - Faraday Cup
    - Beam Current Transformer
    - Beam Position Monitor
    - Profile Detectors
      - SEMGrids
      - Wire Scanners
    - Beam Loss Monitors
- Second hour
  - Some depicted examples of beam parameter measurements

CAS

THE CERN ACCELERATOR SCHOOL

Introduction

An accelerator can never be better than the instruments measuring its performance!

Different uses of beam diagnostics

- **Regular crude checks of accelerator performance**
  - Beam Intensity
  - Radiation levels
- **Standard regular measurements**
  - Emittance measurement
  - Trajectories
  - Tune
- **Sophisticated measurements e.g. during machine development sessions**
 - May require offline evaluation
 - May be less *comfortable*

CAS

THE CERN ACCELERATOR SCHOOL

Diagnostic devices and quantity measured

Instrument	Physical Effect	Measured Quantity	Effect on beam
Faraday Cup	Charge collection	Intensity	Destructive
Current Transformer	Magnetic field	Intensity	Non destructive
Wall current monitor	Image Current	Intensity Longitudinal beam shape	Non destructive
Pick-up	Electric/magnetic field	Position	Non destructive
Secondary emission monitor	Secondary electron emission	Transverse size/shape, emittance	Disturbing, can be destructive at low energies
Wire Scanner	Secondary particle creation	Transverse size/shape	Slightly disturbing
Scintillator screen	Atomic excitation with light emission	Transverse size/shape (position)	Destructive
Residual Gas monitor	Ionization	Transverse size/shape	Non destructive

CAS

THE CERN ACCELERATOR SCHOOL

A beam parameter measurement

Front End Computer and Interfaces

THE CERN ACCELERATOR SCHOOL

Required Competence in a beam diagnostics group

- Some beam physics in order to understand the beam parameters to be measured and to distinguish beam effects from sensor effects
- Detector physics to understand the interaction of the beam with the sensor
- Mechanics
- Analogue signal treatment
  - Low noise amplifiers
  - High frequency analogue electronics
- Digital signal processing
- Digital electronics for data readout
- Front-end and Application Software

Layout of a Faraday Cup

- Electrode: 1 mm stainless steel

- Only low energy particles can be measured

- Very low intensities (down to 1 pA) can be measured

- Creation of secondary electrons of low energy (below 20 eV)

- Repelling electrode with some 100 V polarisation voltage pushes secondary electrons back onto the electrode

Bride Adaptation Fixe DN150CF/DN40CF

Système IN/OUT
Traversée Lineaire.

CAS

THE CERN ACCELERATOR SCHOOL

Faraday Cup

CAS

THE CERN ACCELERATOR SCHOOL
Electro-static Field in Faraday Cup

In order to keep secondary electrons with the cup a repelling voltage is applied to the polarization electrode

Since the electrons have energies of less than 20 eV some 100V repelling voltage is sufficient
Energy of secondary emission electrons

- With increasing repelling voltage the electrons do not escape the Faraday Cup any more and the current measured stays stable.

- At 40V and above no decrease in the Cup current is observed any more

I_{total} vs. eV

Legend: 90keV, 50keV, 30keV

I(μA)

THE CERN ACCELERATOR SCHOOL
Faraday Cup with water cooling
For higher intensities
water cooling may be needed

CAS

Current Transformers

Magnetic field

r_i

r_o
Fields are very low

Capture magnetic field lines with cores of high relative permeability

(CoFe based amorphous alloy Vitrovac: $\mu_r = 10^5$)

Beam current

$$I_{beam} = \frac{qeN}{t} = \frac{qeN\beta c}{l}$$

$$L = \frac{\mu_0 \mu_r}{2\pi} l N^2 \ln \frac{r_0}{r_i}$$

CAS

THE CERN ACCELERATOR SCHOOL

$$U(t) = L \frac{dI_{beam}(t)}{dt} \frac{R}{N} e^{-\frac{t}{\tau_{droop}}}$$
Inductance L of the winding

$$\tau_{rise} = \sqrt{L_s C_s}$$

$$\tau_{droop} = \frac{L}{\frac{R}{A} + R_L} \approx \frac{L}{R_L}$$

Beam signal

THE CERN ACCELERATOR SCHOOL

Fast current transformers for the LHC

CAS
THE CERN ACCELERATOR SCHOOL

The transformer installed in the machine
Needs
Magnetic Shielding

Magnetic shielding

- Shield should extend along the vacuum chamber length > diameter of opening
- Shield should be symmetrical to the beam axis
- Air gaps must be avoided especially along the beam axis
- Shield should have highest µ possible but should not saturate

monitor

Permalloy (µ3)

Soft iron (µ1)

Transformer steel (µ2)

CAS

THE CERN ACCELERATOR SCHOOL
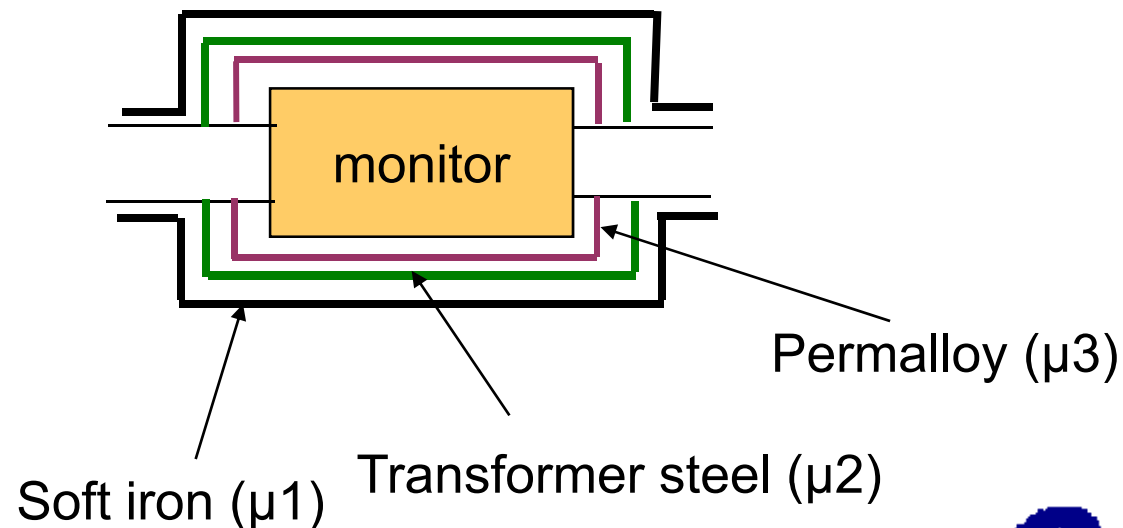

Calibration of AC current transformers
- The transformer is calibrated with a very precise current source
- The calibration signal is injected into a separate calibration winding
- A calibration procedure executed before the running period
- A calibration pulse before the beam pulse measured with the beam signal
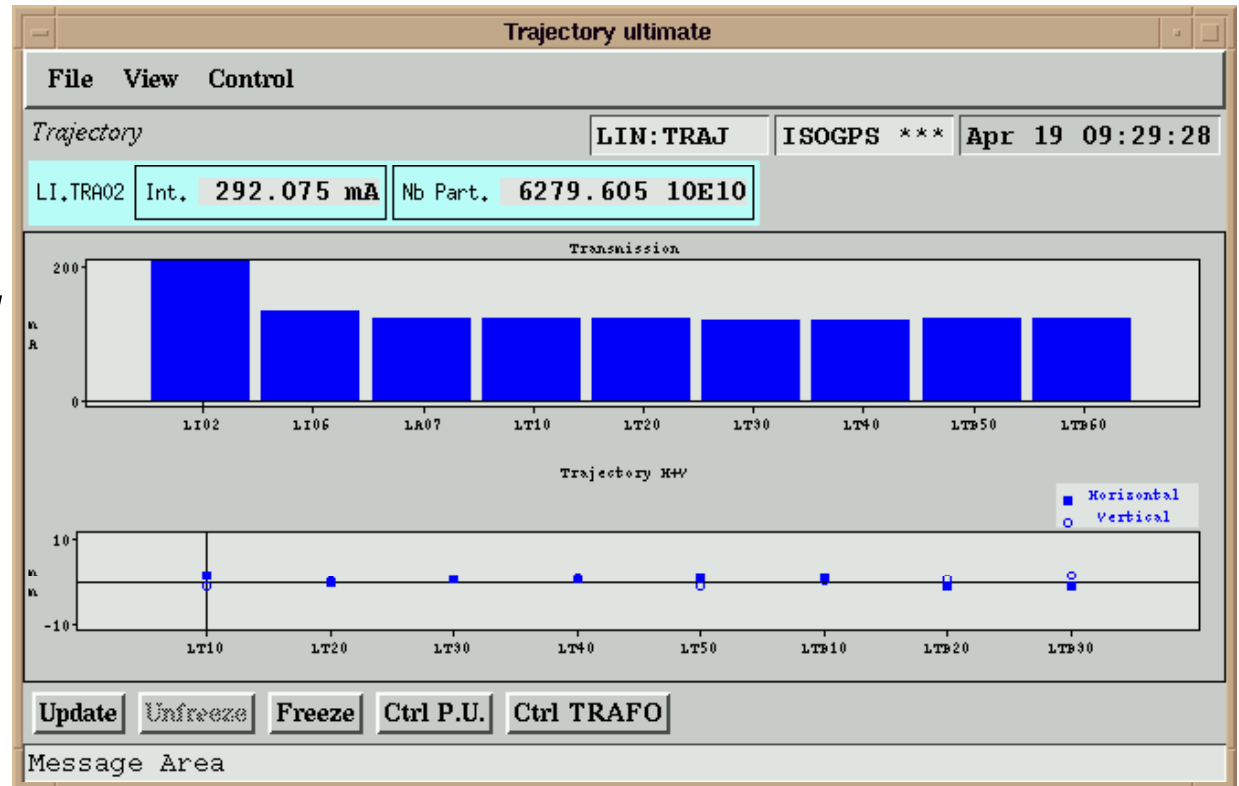

CAS

THE CERN ACCELERATOR SCHOOL

Current transformer and its electronics
Display of transformer readings

- Transformers in a transfer line
- Calculated losses trigger a *watchdog*
- Display distributed via video signal

The DC current transformer

- AC current transformer can be extended to very long droop times but not to DC
- Measuring DC currents is needed in storage rings
- Must provide a modulation frequency
- Takes advantage of non/linear magnetisation curve

THE CERN ACCELERATOR SCHOOL

Principle of DCCT

$V_a - V_b$

Synchronous detector

V_a

V_b

modulator

Power supply

beam

Compensation current $I_{feedback} = -I_{beam}$

R $V = RI_{beam}$

CAS

THE CERN ACCELERATOR SCHOOL
Modulation of a DCCT without beam

B=f(t)

$$U = NA\frac{dB}{dt}$$

$$B = \frac{\int U dt}{NA} + B_0$$

Modulation current has only odd harmonic frequencies since the signal is symmetric

1 2 3 4 5

CAS

THE CERN ACCELERATOR SCHOOL

Modulation of a DCCT with beam

B=f(t)

B

H
Sum signal becomes non-zero
Even harmonics appear

1   2   3   4   5

CERN

CAS

THE CERN ACCELERATOR SCHOOL

Modulation current difference signal with beam

- Difference signal has $2\omega_m$
- ω_m typically 200 Hz – 10 kHz
- Use low pass filter with
  $\omega_c << \omega_m$
- Provide a 3rd core, normal AC transformer to extend to higher frequencies

Position measurements

If the beam is much smaller than w, all field lines are captured and U is a linear function with replacement
else: Linear cut (projection to measurement plane must be linear)
Shoebox pick-up

Linear cut through a shoebox

$$x \propto \frac{U_L - U_R}{U_L + U_R} = \frac{\Delta}{\Sigma}$$

U_L

U_R

CAS

THE CERN ACCELERATOR SCHOOL

Doubly cut shoebox

- Can measure horizontal and vertical position at once
- Has 4 electrodes

Simulatenous horizontal and vertical measurement

horizontal

vertical

$$X = \frac{(U_a + U_c) - (U_b + U_d)}{\Sigma U}$$

$$Y = \frac{(U_a + U_b) - (U_c + U_d)}{\Sigma U}$$

CAS

THE CERN ACCELERATOR SCHOOL

Interaction of particles with matter

- Coulomb interaction
- Average force in s-direction=0
- Average force in transverse direction <> 0
- Mostly large impact parameter => low energy of ejected electron
- Electron mostly ejection transversely to the particle motion

Beam particle

b

F

Atomic shell electron

s

CAS

THE CERN ACCELERATOR SCHOOL
Bethe Bloch formula
$$-\frac{dE}{dx} = 4\pi N_A r_e^2 m_e c^2 \frac{Z_T}{A_T} \rho \frac{Z_p^2}{\beta^2} [\ln \frac{2m_e c^2 \gamma^2 \beta^2}{I} - \beta^2]$$

- with the following constants:
    - NA: Avogadro's number
    - m_e and r_e: electron rest mass and classical electron radius
    - c: speed of light
- the following target material properties:
    - ρ: material density
    - A_T and Z_T: the atomic mass and nuclear charge
- and the particle properties:
    - Z_p: particle charge
    - β: the particles velocity and $\gamma = \sqrt{1 - \beta^2}$

Dependance on Z_p^2

CAS

THE CERN ACCELERATOR SCHOOL

High energy loss a low energies

$$\frac{dE}{dx}[\frac{MeV}{g/cm^2}]$$

0.01   0.1   1   10   100   1000

Heavy ions at low energy are stopped within a few micro-meters
All energy is deposited in a very small volume

CAS

THE CERN ACCELERATOR SCHOOL

Scintillating Screens

Method already applied in cosmic ray experiments

- Very simple
- Very convincing

Needed:

- Scintillating Material
- TV camera
- In/out mechanism

Problems:

- Radiation resistance
- Heating of screen (absorption of beam energy)
- Evacuation of electric charges

Frame grabber

- For further evaluation the video signal is digitized, read-out and treated by program
THE CERN ACCELERATOR SCHOOL

Test for resistance against heat-shock

| Material	ρ g/cm³	c_p at 20°C J/gK	k at 100°C W/mK	T_{max} °C	R at 400 °C $\Omega.cm$
Al_2O_3	3.9	0.9	30	1600	10^{12}
ZrO_2	6	0.4	2	1200	10^3
BN	2	1.6	35	2400	10^{14}

Better for electrical conductivity (>400°C)

Better for thermal properties
(higher conductivity, higher heat capacity)

CAS

THE CERN ACCELERATOR SCHOOL
Degradation of screen

Degradation clearly visible
However sensitivity stays essentially
the same

Zirconium Oxide : ZrO_2

CAS

THE CERN ACCELERATOR SCHOOL
Screen mechanism

- Screen with graticule

CAS

THE CERN ACCELERATOR SCHOOL

Profile measurements

- ## Secondary emission grids (SEMgrids)

When the beam passes secondary electrons are ejected from the ribbons

The current flowing back onto the ribbons is measured

Electrons are taken away by polarization voltage

One amplifier/ADC chain channel per ribbon

CAS

THE CERN ACCELERATOR SCHOOL

SEMgrids with wires

THE CERN ACCELERATOR SCHOOL

Profiles from SEMgrids

Projection of charge density projected to x or y axis is Measured
One amplifier/ADC per wire Large dynamic range

Resolution is given by wire distance
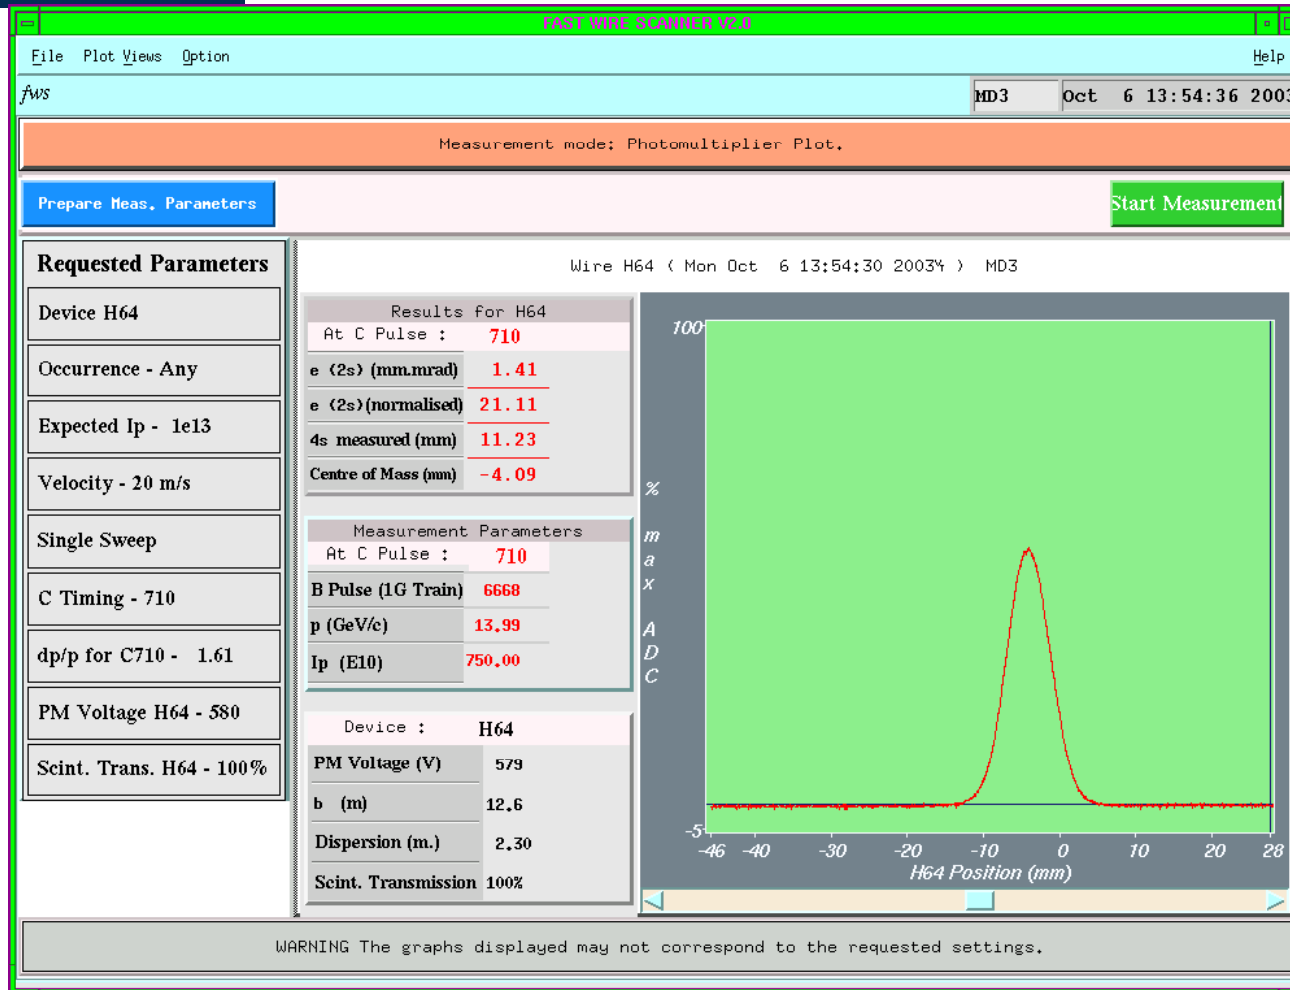

Used only in transfer lines

Wire Scanners

A thin wire is quickly moved across the beam
Secondary particle shower is detected outside the vacuum chamber
on a scintillator/photo-multiplier assembly
Position and photo-multiplier signal are recorded simultaneously

Wire scanner profile

High speed needed because of heating.

Adiabatic damping

Current increase due to Speed increase

Speeds of up to 20m/s => 200g acceleration

Beam power in the LHC

shot

The Linac beam (160 mA, 200µs, 50 MeV, 1Hz) is enough to burn a hole into the vacuum chamber

What about the LHC beam: 2808 bunches of $15*10^{11}$ particles at 7 TeV?

1 bunch corresponds to a 5 kg bullet at 800 km/h

THE CERN ACCELERATOR SCHOOL
Stored Beam Energies

(Based on graph from R. Schmidt)

Quench Levels	Units	*Tevatron*	*RHIC*	*HERA*	*LHC*
Instant loss (0.01 - 10 ms)	[J/cm^3]	4.5 10^{-03}	1.8 10^{-02}	2.1 10^{-03} - 6.6 10^{-03}	8.7 10^{-04}
Steady loss (> 100 s)	[W/cm^3]	7.5 10^{-02}	7.5 10^{-02}		5.3 10^{-03}

CAS

THE CERN ACCELERATOR SCHOOL

Beam Dammage

Fermi Lab'sTevatron has 200 times less beam power than LHC!

Beam Loss Monitor Types

- Design criteria: Signal speed and robustness
- Dynamic range (> 10^9) limited by leakage current through insulator ceramics (lower) and saturation due to space charge (upper limit).

Secondary Emission Monitor (SEM):

- Length 10 cm
- P < 10^{-7} bar
- ~ 30000 times smaller gain

Ionization chamber:

- N_2 gas filling at 100 mbar over-pressure
- Length 50 cm
- Sensitive volume 1.5 l
- Ion collection time 85 μs

- Both monitors:
  - Parallel electrodes (Al, SEM: Ti) separated by 0.5 cm
  - Low pass filter at the HV input
 - Voltage 1.5 kV
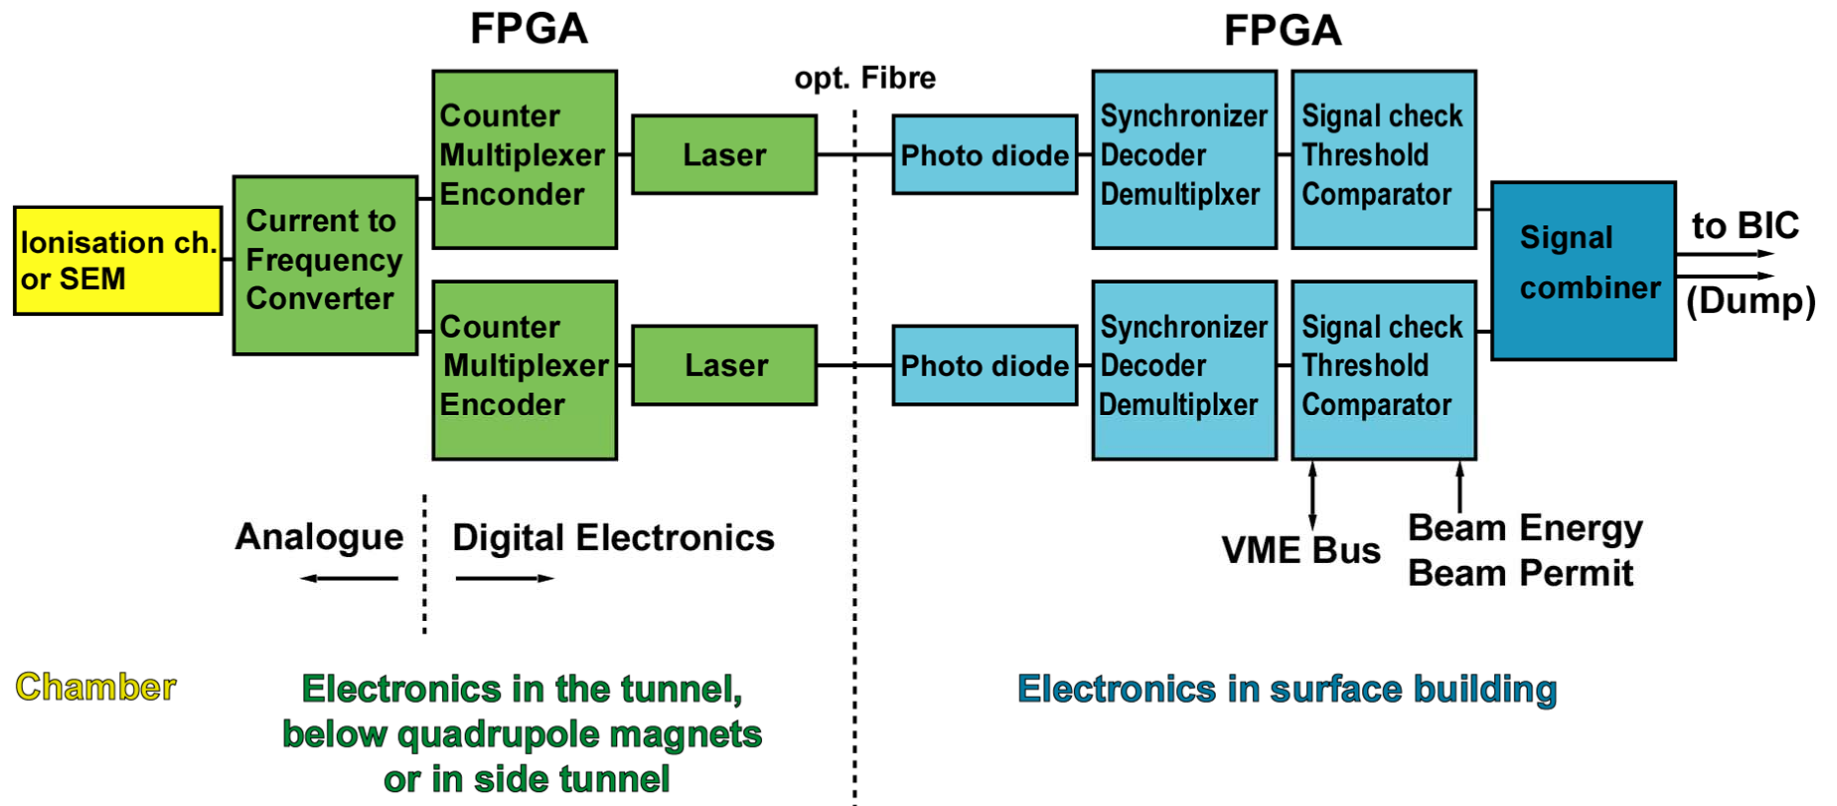

CAS

THE CERN ACCELERATOR SCHOOL

Quench levels

Industrial production of chambers

Beam loss must be measured all around the ring
=> 4000 sensors!

CAS

THE CERN ACCELERATOR SCHOOL

System layout

Successive running sums
