Basic formulas for electron rings

Feb. 26 - 27, 2018
CERN Accelerator School @ Zürich

K. Oide

katsunobu.oide @ cern.ch
Contents

1. Basics
   - Variables
   - Hamiltonian
   - Transfer matrix
     - Symplecticity
2. Transformation of simple elements
   - Drift space
     - Chromaticity
   - Dipole magnet
   - Thin multipole magnet
     - Thin quadrupole magnet
   - RF cavity
3. FODO cells
   - Typical structure of a collider
     - Various arc lattices
   - Transfer matrix of a FODO cell
   - Twiss parameters
   - Twiss parameters along a beam line
3. FODO cells (cont’d)
   - Dispersion
   - Dispersion along a beam line
   - Momentum compaction
   - Synchrotron motion

4. Overview of synchrotron radiation
   - Critical energy
   - Some fundamental formulas
   - Energy loss
   - About $<N><u^2>$

5. Effects of radiation on beam motion
   - basics
   - Local radiation damping
   - Effects of dispersion on damping
   - Damping per revolution
   - Momentum spread
   - Transverse emittance
   - Longitudinal emittance
   - X-y coupling
   - Emittance by opening angle of photons
   - Synchrotron radiation integrals
Variables

In this lecture we use *canonical* variables:

\[(x, p_x, y, p_y, z, \delta),\]  \hspace{1cm} (1)
Variables

In this lecture we use canonical variables:

$$(x, p_x, y, p_y, z, \delta),$$  \hspace{1cm} (1)

where momenta are normalized by design momentum $P_d$ as:

$$p_x \equiv P_x / P_d,$$
$$p_y \equiv P_y / P_d,$$
$$z \equiv -v(t - t_0),$$
$$\delta \equiv (P - P_d)/P_d,$$ \hspace{1cm} (2)

where we have introduced the total momentum $P$, the design arrival time $t_0 = t_0(s)$, and the total velocity $v = cP/mc^2 + P^2$. For a storage ring, usually $P_d$ is chosen constant over the entire ring.
Variables

In this lecture we use canonical variables:

\[(x, p_x, y, p_y, z, \delta),\]  

(1)

where momenta are normalized by design momentum \(P_d\) as:

\[p_x \equiv P_x / P_d,\]
\[p_y \equiv P_y / P_d,\]
\[z \equiv -v(t - t_0),\]
\[\delta \equiv (P - P_d) / P_d,\]  

(2)

where we have introduced the total momentum \(P\), the design arrival time \(t_0 = t_0(s)\), and the total velocity \(v = cP / \sqrt{m^2c^2 + P^2}\). For a storage ring, usually \(P_d\) is chosen constant over the entire ring.
Variables

In this lecture we use canonical variables:

\[(x, p_x, y, p_y, z, \delta),\] (1)

where momenta are normalized by design momentum \(P_d\) as:

\[
p_x \equiv P_x / P_d, \\
p_y \equiv P_y / P_d, \\
z \equiv -v(t - t_0), \\
\delta \equiv (P - P_d)/P_d,
\] (2)

where we have introduced the total momentum \(P\), the design arrival time \(t_0 = t_0(s)\), and the total velocity \(v = cP / \sqrt{m^2c^2 + P^2}\). For a storage ring, usually \(P_d\) is chosen constant over the entire ring.

These variables are functions of \(s\), which is the length along the coordinate line.
Hamiltonian

For the variables defined above, the Hamiltonian is written as

\[
H = -(1 + x/\rho) \sqrt{(1 + \delta + \varphi/c)^2 - (p_x - A_x)^2 - (p_y - A_y)^2} \\
- (1 + x/\rho)A_z - (xp_y - yp_x)/\tau + \frac{E}{v_d} + \left(\frac{1}{v} + \frac{1}{c}\right) z \frac{\partial \varphi}{\partial s},
\]

where \( \rho, \tau, \) and \( v_d \) are the bending radius, the torsion, and the design velocity, respectively, and \( E = c \sqrt{(1 + \delta + \varphi/c)^2 + m^2 c^2 / P_d^2} + \varphi \) is the (normalized) energy.
Hamiltonian

For the variables defined above, the Hamiltonian is written as

\[
H = - (1 + x/\rho) \sqrt{(1 + \delta + \varphi/c)^2 - (p_x - A_x)^2 - (p_y - A_y)^2} \\
- (1 + x/\rho) A_z - (xp_y - yp_x)/\tau + \frac{E}{v_d} + \left(\frac{1}{v} + \frac{1}{c}\right) \frac{z}{\partial s} \frac{\partial \varphi}{\partial s},
\]

where \(\rho\), \(\tau\), and \(v_d\) are the bending radius, the torsion, and the design velocity, respectively, and \(E = c \sqrt{(1 + \delta + \varphi/c)^2 + m^2 c^2 / P_d^2} + \varphi\) is the (normalized) energy.
Hamiltonian

For the variables defined above, the Hamiltonian is written as

\[
H = - (1 + x \rho) \sqrt{(1 + \delta + \varphi/c)^2 - (p_x - A_x)^2 - (p_y - A_y)^2} \\
- (1 + x \rho) A_z - (xp_y - yp_x) \tau + \frac{E}{v_d} + \left( \frac{1}{v} + \frac{1}{c} \right) z \frac{\partial \varphi}{\partial s},
\]

(3)

where \( \rho, \tau, \) and \( v_d \) are the bending radius, the torsion, and the design velocity, respectively, and \( E = c \sqrt{(1 + \delta + \varphi/c)^2 + m^2 c^2 / P_d^2} + \varphi \) is the (normalized) energy.
Hamiltonian

For the variables defined above, the Hamiltonian is written as

\[
H = - (1 + x(\rho) \sqrt{(1 + \delta + \varphi/c)^2 - (p_x - A_x)^2 - (p_y - A_y)^2}
\]
\[
- (1 + x(\rho) A_z - (xp_y - yp_x)/\tau) + \frac{E}{v_d} + \left(\frac{1}{v} + \frac{1}{c}\right) z \frac{\partial \varphi}{\partial s},
\]

where \(\rho\), \(\tau\), and \(v_d\) are the bending radius, the torsion, and the design velocity, respectively, and \(E = c \sqrt{(1 + \delta + \varphi/c)^2 + m^2c^2/P_d^2} + \varphi\) is the (normalized) energy.
Hamiltonian

For the variables defined above, the Hamiltonian is written as

\[ H = - (1 + x(\rho) \sqrt{(1 + \delta + \varphi/c)^2 - (p_x - A_x)^2 - (p_y - A_y)^2} \\
- (1 + x(\rho) A_z - (xp_y - yp_x)/\tau) \left( \frac{E}{v_d} + \left( \frac{1}{v} + \frac{1}{c} \right) z \frac{\partial \varphi}{\partial s} \right), \]

where \( \rho, \tau, \) and \( v_d \) are the bending radius, the torsion, and the design velocity, respectively, and \( E = c \sqrt{(1 + \delta + \varphi/c)^2 + m^2 c^2 / P_d^2} + \varphi \) is the (normalized) energy.

The bending radius and the torsion are associated with the coordinate system and not with the motion of particles. Thus usually we do not have to use the torsion \( \tau \), even if particles are doing helical motions.
Hamiltonian

For the variables defined above, the Hamiltonian is written as

\[
H = -(1 + x/\rho) \sqrt{(1 + \delta + \varphi/c)^2 - (p_x - A_x)^2 - (p_y - A_y)^2} \\
- (1 + x/\rho) A_z - (xp_y - yp_x)/\tau + \frac{E}{v_d} + \left(\frac{1}{v/c}\right) z \frac{\partial \varphi}{\partial s},
\]

where \(\rho\), \(\tau\), and \(v_d\) are the bending radius, the torsion, and the design velocity, respectively, and \(E = c \sqrt{(1 + \delta + \varphi/c)^2 + m^2c^2/P_d^2} + \varphi\) is the (normalized) energy.

The bending radius and the torsion are associated with the coordinate system and not with the motion of particles. Thus usually we do not have to use the torsion \(\tau\), even if particles are doing helical motions.

The external fields are expressed by (normalized) electromagnetic potentials \((A_x, A_y, A_z, \varphi)\), which are functions of \((x, y, z; s)\). In the case of magnets or RF cavities without a solenoid component \(B_z\), only \(A_z\) is necessary to express the field. In such cases the Hamiltonian is simplified to

\[
H = -(1 + x/\rho) \sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} - (1 + x/\rho)A_z + \frac{E}{v_d}.
\]
Hamiltonian

For the variables defined above, the Hamiltonian is written as

\[ H = - (1 + x/\rho) \sqrt{(1 + \delta + \varphi/c)^2 - (p_x - A_x)^2 - (p_y - A_y)^2} \]
\[ - (1 + x/\rho) A_z - (xp_y - yp_x)/\tau + \frac{E}{v_d} + \left( \frac{1}{v} + \frac{1}{c} \right) z \frac{\partial \varphi}{\partial s}, \]  

(3)

where \( \rho \), \( \tau \), and \( v_d \) are the bending radius, the torsion, and the design velocity, respectively, and \( E = c \sqrt{(1 + \delta + \varphi/c)^2 + m^2 c^2 / P_d^2} + \varphi \) is the (normalized) energy.

The bending radius and the torsion are associated with the coordinate system and not with the motion of particles. Thus usually we do not have to use the torsion \( \tau \), even if particles are doing helical motions.

The external fields are expressed by (normalized) electromagnetic potentials \( (A_x, A_y, A_z, \varphi) \), which are functions of \((x, y, z; s)\). In the case of magnets or RF cavities without a solenoid component \( B_z \), only \( A_z \) is necessary to express the field. In such cases the Hamiltonian is simplified to

\[ H = -(1 + x/\rho) \sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} - (1 + x/\rho)A_z + \frac{E}{v_d}. \]  

(4)
Hamiltonian

For the variables defined above, the Hamiltonian is written as

\[
H = - (1 + x/\rho) \sqrt{(1 + \delta + \varphi/c)^2 - (p_x - A_x)^2 - (p_y - A_y)^2} \\
- (1 + x/\rho) A_z - (xp_y - yp_x) / \tau + \frac{E}{v_d} + \left(\frac{1}{v} + \frac{1}{c}\right) z \frac{\partial \varphi}{\partial s},
\]

where \( \rho, \tau, \) and \( v_d \) are the bending radius, the torsion, and the design velocity, respectively, and \( E = c \sqrt{(1 + \delta + \varphi/c)^2 + m^2 c^2 / P_d^2 + \varphi} \) is the (normalized) energy.

The bending radius and the torsion are associated with the coordinate system and not with the motion of particles. Thus usually we do not have to use the torsion \( \tau \), even if particles are doing helical motions.

The external fields are expressed by (normalized) electromagnetic potentials \( (A_x, A_y, A_z, \varphi) \), which are functions of \( (x, y, z; s) \). In the case of magnets or RF cavities without a solenoid component \( B_z \), only \( A_z \) is necessary to express the field. In such cases the Hamiltonian is simplified to

\[
H = -(1 + x/\rho) \sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} - (1 + x/\rho) A_z + \frac{E}{v_d}.
\]
Transfer Matrix

If a particle does a motion from \( s_0 \) to \( s \), a transfer matrix \( M \) from \( s_0 \) to \( s \) is defined by

\[
M = \frac{\partial(x, p_x, y, p_y, z, \delta)}{\partial(x_0, p_{x0}, y_0, p_{y0}, z_0, \delta_0)}, \tag{5}
\]

where variables sufficed by 0 mean the initial value at \( s = s_0 \).
Transfer Matrix

If a particle does a motion from $s_0$ to $s$, a transfer matrix $M$ from $s_0$ to $s$ is defined by

$$M = \frac{\partial(x, p_x, y, p_y, z, \delta)}{\partial(x_0, p_{x0}, y_0, p_{y0}, z_0, \delta_0)},$$

(5)

where variables sufficed by 0 mean the initial value at $s = s_0$.

In general $M$ depends on the initial values $(x_0, p_{x0}, y_0, p_{y0}, z_0, \delta_0)$. 

It is known for a symplectic motion that the beam emittance, the spread of the beam in the phase space, is preserved in each plane, once the variables are chosen properly.
Transfer Matrix

If a particle does a motion from \( s_0 \) to \( s \), a transfer matrix \( M \) from \( s_0 \) to \( s \) is defined by

\[
M = \frac{\partial (x, p_x, y, p_y, z, \delta)}{\partial (x_0, p_{x0}, y_0, p_{y0}, z_0, \delta_0)},
\]

where variables sufficed by 0 mean the initial value at \( s = s_0 \).

In general \( M \) depends on the initial values \( (x_0, p_{x0}, y_0, p_{y0}, z_0, \delta_0) \).

The most fundamental nature of the transfer matrix for a motion associated with a Hamiltonian is the symplectic condition:

\[
^tMJM = J,
\]

\[
J \equiv \begin{pmatrix}
. & 1 & . & . & . & \ldots \\
-1 & . & . & . & . & \ldots \\
. & . & . & 1 & . & \ldots \\
. & . & -1 & . & . & \ldots \\
. & . & . & . & . & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots 
\end{pmatrix}.
\]
**Transfer Matrix**

If a particle does a motion from \( s_0 \) to \( s \), a transfer matrix \( M \) from \( s_0 \) to \( s \) is defined by

\[
M = \frac{\partial(x, p_x, y, p_y, z, \delta)}{\partial(x_0, p_{x0}, y_0, p_{y0}, z_0, \delta_0)},
\]

where variables sufficed by 0 mean the initial value at \( s = s_0 \).

In general \( M \) depends on the initial values \((x_0, p_{x0}, y_0, p_{y0}, z_0, \delta_0)\).

The most fundamental nature of the transfer matrix for a motion associated with a Hamiltonian is the *symplectic condition*:

\[
'MJM = J , \quad J \equiv \begin{pmatrix}
Symplectic condition

\[
\begin{pmatrix}
* & * & * & * & * & \cdots \\
* & * & * & * & * & \cdots \\
* & * & * & * & * & \cdots \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\
\end{pmatrix}
\]
Symplectic condition

\[
\begin{pmatrix}
\ast & \ast & \ast & \ast & \ast & \cdots \\
\ast & \ast & \ast & \ast & \ast & \cdots \\
\ast & + & \ast & \ast & \ast & \cdots \\
\ast & \ast & \ast & \ast & \ast & \cdots \\
\ast & + & \ast & \ast & \ast & \cdots \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots
\end{pmatrix}
\]

= 1
Symplectic condition

\[
\begin{pmatrix}
* & * & * & * & \cdots \\
* & * & * & * & \cdots \\
* & * & * & * & \cdots \\
* & * & * & * & \cdots \\
\cdots & \cdots & \cdots & \cdots & \cdots \\
\end{pmatrix}
\]

\[= 1\]

\(\times\) : 2 by 2 determinant
Symplectic condition

\[
\begin{pmatrix}
* & * & * & * & \cdots \\
* & + & * & * & \cdots \\
* & * & + & * & \cdots \\
& \cdots & \cdots & \cdots & \cdots \\
\end{pmatrix} = 1
\]

\[
\begin{pmatrix}
* & * & * & * & \cdots \\
* & + & * & * & \cdots \\
* & * & + & * & \cdots \\
& \cdots & \cdots & \cdots & \cdots \\
\end{pmatrix} = 0
\]

\(\times\): 2 by 2 determinant
The sum of 2 by 2 determinants between two columns or two rows are:

\[
\begin{align*}
\begin{pmatrix}
* & * & * & * & \cdots \\
* & * & * & * & \cdots \\
* & * & * & * & \cdots \\
\vdots & \vdots & \vdots & \vdots & \vdots \\
\end{pmatrix} &= 1 \\
\begin{pmatrix}
* & * & * & * & \cdots \\
* & * & * & * & \cdots \\
* & * & * & * & \cdots \\
\vdots & \vdots & \vdots & \vdots & \vdots \\
\end{pmatrix} &= 0
\end{align*}
\]
Drift space

A drift space is a field-free region in the beam line. Its Hamiltonian is

\[ H = -\sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} + \frac{E}{v_d}. \]  

(7)
A drift space is a field-free region in the beam line. Its Hamiltonian is

\[ H = -\sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} + \frac{E}{v_d} . \]  

(7)

The solution of the motion for a drift space with a length \( L \) is

\[ x = x_0 + \frac{p_{x0}}{p_z} L , \]

\[ p_x = p_{x0} \]

\[ y = y_0 + \frac{p_{y0}}{p_z} L , \]

\[ p_y = p_{y0} \]

\[ z = z_0 + \left( \frac{v}{v_d} - \frac{1 + \delta_0}{p_z} \right) L , \]

\[ \delta = \delta_0 , \]  

(8)
Drift space

A drift space is a field-free region in the beam line. Its Hamiltonian is

\[ H = -\sqrt{(1 + \delta)^2 - p_x^2 - p_y^2 + \frac{E}{v_d}}. \]  

The solution of the motion for a drift space with a length \( L \) is

\[ x = x_0 + \frac{p_{x0}}{p_z} L, \quad p_x = p_{x0} \]
\[ y = y_0 + \frac{p_{y0}}{p_z} L, \quad p_y = p_{y0} \]
\[ z = z_0 + \left( \frac{v}{v_d} - \frac{1 + \delta_0}{p_z} \right) L, \quad \delta = \delta_0, \]

where we have used

\[ p_z \equiv \sqrt{(1 + \delta)^2 - p_x^2 - p_y^2}. \]
Drift space

A drift space is a field-free region in the beam line. Its Hamiltonian is

\[ H = -\sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} + \frac{E}{v_d}. \]  

(7)

The solution of the motion for a drift space with a length \( L \) is

\[ x = x_0 + p_x \frac{x_0}{p_z} L, \quad p_x = p_{x_0} \]
\[ y = y_0 + p_y \frac{y_0}{p_z} L, \quad p_y = p_{y_0} \]
\[ z = z_0 + \left( \frac{v}{v_d} - \frac{1 + \delta_0}{p_z} \right) L, \quad \delta = \delta_0, \]

(8)

where we have used

\[ p_z \equiv \sqrt{(1 + \delta)^2 - p_x^2 - p_y^2}. \]  

(9)

Note that the motion in a drift space is **nonlinear** in the momenta due to the \( 1/p_z \) dependence.
Drift space (2)

For an on-axis particle \((x_0, p_{x0}, y_0, p_{y0}) = (0, 0, 0, 0)\), the transfer matrix of a drift space becomes

\[
M = \begin{pmatrix}
1 & \frac{L}{1 + \delta} & \cdots & \cdots & \cdots \\
\cdot & 1 & \frac{L}{1 + \delta} & \cdots & \cdots \\
\cdot & \cdot & 1 & \frac{L}{1 + \delta} & \cdots \\
\cdot & \cdot & \cdot & 1 & \frac{v - v_d}{v_d} L \\
\cdot & \cdot & \cdot & \cdot & 1
\end{pmatrix},
\]  

(10)

since, for instance,

\[
x = x_0 + \frac{p_{x0}}{p_z} L, \\
y = y_0 + \frac{p_{y0}}{p_z} L, \\
z = z_0 + \left(\frac{v}{v_d} - \frac{1 + \delta_0}{p_z}\right) L,
\]
Drift space (2)

For an on-axis particle \((x_0, p_{x0}, y_0, p_{y0}) = (0, 0, 0, 0)\), the transfer matrix of a drift space becomes

\[
M = \begin{pmatrix}
1 & \frac{L}{1 + \delta} & \cdots & \cdots & \cdots \\
\vdots & 1 & \frac{L}{1 + \delta} & \cdots & \cdots \\
\vdots & \vdots & 1 & \frac{L}{1 + \delta} & \cdots \\
\vdots & \vdots & \vdots & 1 & \frac{L}{1 + \delta} \\
\vdots & \vdots & \vdots & \vdots & \vdots
\end{pmatrix},
\]

since, for instance,

\[
\frac{\partial x}{\partial p_{x0}} = \frac{\partial}{\partial p_{x0}} \left( \frac{p_{x0}}{p_{z0}} L \right) = \left( \frac{1}{p_{z0}} - \frac{p_{x0}^2}{p_{z0}^3} \right) L = \left( \frac{1}{p_{z0}} + \frac{p_{x0}^2}{p_{z0}^3} \right) L
\]

\[
= \frac{L}{1 + \delta}, \quad \therefore \ p_{x0} = p_{y0} = 0, \ p_{z} = 1 + \delta.
\]
Drift space (2)

For an on-axis particle \((x_0, p_{x0}, y_0, p_{y0}) = (0, 0, 0, 0)\), the transfer matrix of a drift space becomes

\[
M = \begin{pmatrix}
1 & \frac{L}{1 + \delta} & \cdots & \cdots & \cdots \\
\vdots & 1 & \frac{L}{1 + \delta} & \cdots & \cdots \\
\vdots & \vdots & 1 & \frac{L}{1 + \delta} & \cdots \\
\vdots & \vdots & \vdots & 1 & \frac{v - v_d L}{v_d} \\
\vdots & \vdots & \vdots & \vdots & \frac{v - v_d L}{v_d} \\
\end{pmatrix},
\]  

(10)

since, for instance,

\[
\frac{\partial x}{\partial p_{x0}} = \frac{\partial}{\partial p_{x0}} \left( \frac{p_{x0}}{p_z} \right) = \left( \frac{1}{p_z} - \frac{p_{x0}}{p_z^2} \frac{\partial p_z}{\partial p_{x0}} \right) L = \left( \frac{1}{p_z} + \frac{p_{x0}^2}{p_z^3} \right) L
\]

\[
= \frac{L}{1 + \delta}, \quad \therefore p_{x0} = p_{y0} = 0, p_z = 1 + \delta.
\]

Thus the "length" of a drift has a \(1/(1 + \delta)\) dependence on the momentum offset \(\delta\). This is the source of natural chromaticity.
Chromaticity

If we approximate the Hamiltonian of a drift space up to the second order of $p_x$ and $p_y$:

$$H \approx -(1 + \delta) \left( 1 - \frac{p_x^2}{2(1 + \delta)^2} - \frac{p_y^2}{2(1 + \delta)^2} \right) + \frac{E}{v_d},$$

(11)
Chromaticity

If we approximate the Hamiltonian of a drift space up to the second order of \( p_x \) and \( p_y \):

\[
H \approx -(1 + \delta) \left( 1 - \frac{p_x^2}{2(1 + \delta)^2} - \frac{p_y^2}{2(1 + \delta)^2} \right) + \frac{E}{v_d},
\]

(11)

the change of path length \( dz/ds \) due to the transverse momenta is expressed as

\[
dz/ds = \frac{\partial H}{\partial \delta} = -\frac{p_x^2}{2(1 + \delta)^2} - \frac{p_y^2}{2(1 + \delta)^2} + \frac{v - v_d}{v_d}.
\]

(12)
Chromaticity

If we approximate the Hamiltonian of a drift space up to the second order of $p_x$ and $p_y$:

$$H \approx -(1 + \delta) \left( 1 - \frac{p_x^2}{2(1 + \delta)^2} - \frac{p_y^2}{2(1 + \delta)^2} \right) + \frac{E}{v_d},$$

(11)

the change of path length $dz/ds$ due to the transverse momenta is expressed as

$$\frac{dz}{ds} = \frac{\partial H}{\partial \delta} = -\frac{p_x^2}{2(1 + \delta)^2} - \frac{p_y^2}{2(1 + \delta)^2} + \frac{v - v_d}{v_d}.$$  

(12)

It means that the change of the path length should be proportional to the transverse actions (another canonical variable, square of the amplitudes in the normalized phase space, to be introduced later):

$$\Delta z = 2\pi \xi_x J_x + 2\pi \xi_y J_y$$

with coefficients $\xi_x, \xi_y$. 

$$H = -\sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} + \frac{E}{v_d}.$$
Chromaticity

If we approximate the Hamiltonian of a drift space up to the second order of $p_x$ and $p_y$:

$$H \approx -(1 + \delta) \left( 1 - \frac{p_x^2}{2(1 + \delta)^2} - \frac{p_y^2}{2(1 + \delta)^2} \right) + \frac{E}{v_d}, \quad (11)$$

the change of path length $dz/ds$ due to the transverse momenta is expressed as

$$\frac{dz}{ds} = \frac{\partial H}{\partial \delta} = -\frac{p_x^2}{2(1 + \delta)^2} - \frac{p_y^2}{2(1 + \delta)^2} + \frac{v - v_d}{v_d}. \quad (12)$$

It means that the change of the path length should be proportional to the transverse actions (another canonical variable, square of the amplitudes in the normalized phase space, to be introduced later):

$$\Delta z = 2\pi \xi_x J_x + 2\pi \xi_y J_y$$

with coefficients $\xi_x, \xi_y$.

Then since

$$2\pi \xi_x = \frac{\partial \Delta z}{\partial J_x} = \frac{\partial}{\partial J_x} \frac{\partial H}{\partial \delta} = \frac{\partial}{\partial \delta} \frac{\partial H}{\partial J_x} = \frac{\partial \mu_x}{\partial \delta}, \quad (14)$$

we have realized that the coefficients $\xi_{x,y}$ correspond to the momentum derivatives of tunes $\frac{1}{2\pi} \frac{\partial \mu_{x,y}}{\partial \delta}$. 

$$H = -\sqrt{(1 + \delta)^2 - p_x^2 - p_y^2 + \frac{E}{v_d}}.$$
Chromaticity (2)

For an off-momentum particle having \(d\delta\), a small section of a drift space \(d\) has an effective length \(ds/(1 + d\delta) \approx -ds d\delta\). Thus the entire transfer matrix of a stable ring changes to

\[
M' = \begin{pmatrix}
\cos \mu' + \alpha' \sin \mu' & \beta' \sin \mu' \\
\frac{1 + \alpha'^2}{\beta'} \sin \mu' & \cos \mu' - \alpha' \sin \mu'
\end{pmatrix}
\]

By looking at the trace of \(M'\) above we obtain:

\[
2 \cos \mu_0 = 2 \cos \mu + \frac{1}{\cos \mu_0 - \sin \mu_0 dsd\}
\]

By putting \(\mu_0 = \mu + \frac{\delta}{2}\) into above:

\[
\delta = \frac{1}{\cos \mu_0 - \sin \mu_0 dsd}
\]

and

\[
\mu = \frac{1}{\cos \mu_0 - \sin \mu_0 ds}
\]

by integrating over the ring. Thus the natural chromaticity is expressed as

\[
\varepsilon = \frac{\varepsilon_1}{\frac{1}{4} \varepsilon} + \frac{1}{2} \sin \mu_0 ds
\]

Note that \(\varepsilon\) is always negative.
Chromaticity (2)

For an off-momentum particle having $d\delta$, a small section of a drift space $ds$ has an effective length $ds/(1 + d\delta) \approx -dsd\delta$. Thus the entire transfer matrix of a stable ring changes to

$$M' = \begin{pmatrix}
\cos \mu' + \alpha' \sin \mu' & \beta' \sin \mu' \\
\frac{1 + \alpha'^2}{\beta'} \sin \mu' & \cos \mu' - \alpha' \sin \mu'
\end{pmatrix} = \begin{pmatrix} 1 & -dsd\delta \\ -1 & 1 \end{pmatrix} \begin{pmatrix}
\cos \mu + \alpha \sin \mu & \beta \sin \mu \\
\frac{1 + \alpha^2}{\beta} \sin \mu & \cos \mu - \alpha \sin \mu
\end{pmatrix}$$

(15)

By looking at the trace of $M'$ above we obtain:

$$2 \cos \mu_0 = 2 \cos \mu + \frac{1}{2} \sin \mu \frac{dsd\delta}{\beta}$$

(16)

By putting $\mu_0 = \mu + \frac{d\delta}{2}$ into above:

$$d\delta^2 = 1 + \frac{1}{2} \frac{dsd\delta}{\beta}$$

(17)

and

$$d\mu = I_1 + \frac{1}{2} \frac{\mu x, y ds}{\beta}$$

(18)

by integrating over the ring. Thus the natural chromaticity is expressed as

$$\varepsilon x, y \approx \frac{1}{4} \frac{\mu x, y ds}{\beta}$$

(19)

Note that $\varepsilon x, y$ is always negative.
Chromaticity (2)

For an off-momentum particle having \( d\delta \), a small section of a drift space \( ds \) has an effective length \( ds/(1 + d\delta) \approx -d\delta \). Thus the entire transfer matrix of a stable ring changes to

\[
M' = \begin{pmatrix}
\cos \mu' + \alpha' \sin \mu' & \beta' \sin \mu' \\
-\frac{1 + \alpha'^2}{\beta'} \sin \mu' & \cos \mu' - \alpha' \sin \mu'
\end{pmatrix}
\]  
\[
= \begin{pmatrix}
\cos \mu + \left( \alpha + \frac{1 + \alpha^2}{\beta} ds\delta \right) \sin \mu & \beta \sin \mu - (\cos \mu - \alpha \sin \mu) ds\delta \\
\frac{1 + \alpha^2}{\beta} \sin \mu & \cos \mu - \alpha \sin \mu
\end{pmatrix} .
\]  

(15)

By looking at the trace of \( M' \) above we obtain:

\[
2 \cos \mu_0 = 2 \cos \mu + \frac{1}{\beta} \sin \mu dsd\delta .
\]  

(16)

By putting \( \mu_0 = \mu + d\delta \) into above:

\[
d^2\mu = \frac{1}{\beta} d\delta + \frac{1}{\beta} \sin \mu d\delta,
\]  

and

\[
d\mu = \frac{1}{\beta} d\delta + \frac{1}{\beta} \sin \mu \, ds .
\]  

(17)

by integrating over the ring. Thus the natural chromaticity is expressed as

\[
\begin{pmatrix}
\cos x, y
\end{pmatrix} = \begin{pmatrix}
\cos \mu + \alpha \sin \mu
\end{pmatrix}
\]  

\[
\times \begin{pmatrix}
\frac{1 + \alpha^2}{\beta} \sin \mu & \cos \mu - \alpha \sin \mu
\end{pmatrix} .
\]  

(18)

Note that \( \begin{pmatrix}
\cos x, y
\end{pmatrix} \) is always negative.
For an off-momentum particle having $d\delta$, a small section of a drift space $ds$ has an effective length $ds/(1 + d\delta) \approx -d\delta d\delta$. Thus the entire transfer matrix of a stable ring changes to

$$M' = \begin{pmatrix} \cos \mu' + \alpha' \sin \mu' & \beta' \sin \mu' \\ -\frac{1 + \alpha'^2}{\beta'} \sin \mu' & \cos \mu' - \alpha' \sin \mu' \end{pmatrix} = \begin{pmatrix} 1 & -d\delta d\delta \\ 1 & 1 \end{pmatrix} \begin{pmatrix} \cos \mu + \alpha \sin \mu & \beta \sin \mu \\ -\frac{1 + \alpha^2}{\beta} \sin \mu & \cos \mu - \alpha \sin \mu \end{pmatrix}$$

$$= \begin{pmatrix} \cos \mu + \left(\alpha + \frac{1 + \alpha^2}{\beta} dsd\delta\right) \sin \mu & \beta \sin \mu - (\cos \mu - \alpha \sin \mu) dsd\delta \\ \frac{1 + \alpha^2}{\beta} \sin \mu & \cos \mu - \alpha \sin \mu \end{pmatrix}. \quad (15)$$

By looking at the trace of $M'$ above we obtain:

$$2 \cos \mu' = 2 \cos \mu + \frac{1 + \alpha^2}{\beta} \sin \mu dsd\delta. \quad (16)$$
Chromaticity (2)

For an off-momentum particle having \( d\delta \), a small section of a drift space \( ds \) has an effective length \( ds/(1 + d\delta) \approx -d\delta d\delta \). Thus the entire transfer matrix of a stable ring changes to

\[
M' = \begin{pmatrix}
\cos \mu' + \alpha' \sin \mu' & \beta' \sin \mu' \\
-\frac{1 + \alpha'^2}{\beta'} \sin \mu' & \cos \mu' - \alpha' \sin \mu'
\end{pmatrix} = \begin{pmatrix}
1 & -d\delta d\delta \\
-\frac{1 + \alpha^2}{\beta} \sin \mu & \cos \mu - \alpha \sin \mu
\end{pmatrix}
\]

\[
= \begin{pmatrix}
\cos \mu + \left(\alpha + \frac{1 + \alpha^2}{\beta} d\delta d\delta\right) \sin \mu & \beta \sin \mu - (\cos \mu - \alpha \sin \mu) d\delta d\delta \\
\frac{1 + \alpha^2}{\beta} \sin \mu & \cos \mu - \alpha \sin \mu
\end{pmatrix}
\]

By looking at the trace of \( M' \) above we obtain:

\[
2 \cos \mu' = 2 \cos \mu + \frac{1 + \alpha^2}{\beta} \sin \mu d\delta d\delta .
\]

By putting \( \mu' = \mu + d^2 \mu \) into above:

\[
d^2 \mu = -\frac{1 + \alpha^2}{2\beta} d\delta d\delta , \quad \text{and} \quad d\mu = -d\delta \int \frac{1 + \alpha^2}{2\beta} ds
\]

by integrating over the ring. Thus the natural chromaticity is expressed as
Chromaticity (2)

For an off-momentum particle having $d\delta$, a small section of a drift space $ds$ has an effective length $ds/(1 + d\delta) \approx -dsd\delta$. Thus the entire transfer matrix of a stable ring changes to

$$M' = \begin{pmatrix} \cos \mu' + \alpha' \sin \mu' & \beta' \sin \mu' \\ \frac{-1 + \alpha'^2}{\beta'} \sin \mu' & \cos \mu' - \alpha' \sin \mu' \end{pmatrix} = \begin{pmatrix} 1 & -d\delta \sin \mu \\ -d\delta \cos \mu & 1 \end{pmatrix} \begin{pmatrix} \cos \mu + \alpha \sin \mu & \beta \sin \mu \\ \frac{-1 + \alpha^2}{\beta} \sin \mu & \cos \mu - \alpha \sin \mu \end{pmatrix}$$

$$= \begin{pmatrix} \cos \mu + \left(\alpha + \frac{1 + \alpha^2}{\beta} d\delta\right) \sin \mu & \beta \sin \mu - (\cos \mu - \alpha \sin \mu) d\delta \\ \frac{1 + \alpha^2}{\beta} \sin \mu & \cos \mu - \alpha \sin \mu \end{pmatrix}. \quad (15)$$

By looking at the trace of $M'$ above we obtain:

$$2 \cos \mu' = 2 \cos \mu + \frac{1 + \alpha^2}{\beta} \sin \mu dsd\delta. \quad (16)$$

By putting $\mu' = \mu + d^2\mu$ into above:

$$d^2\mu = -\frac{1 + \alpha^2}{2\beta} d\delta, \quad \text{and} \quad d\mu = -d\delta \int \frac{1 + \alpha^2}{2\beta} ds \quad (17)$$

by integrating over the ring. Thus the natural chromaticity is expressed as

$$\xi_{x,y} = \frac{1}{2\pi} \frac{\partial \mu_{x,y}}{\partial \delta} = -\frac{1}{4\pi} \int \frac{1 + \alpha^2_{x,y}}{\beta_{x,y}} ds. \quad (18)$$
For an off-momentum particle having $d\delta$, a small section of a drift space $ds$ has an effective length $ds/(1 + d\delta) \approx -dsd\delta$. Thus the entire transfer matrix of a stable ring changes to

$$M' = \begin{pmatrix} \cos\mu' + \alpha' \sin\mu' & \beta' \sin\mu' \\ -\frac{1 + \alpha'^2}{\beta'} \sin\mu' & \cos\mu' - \alpha' \sin\mu' \end{pmatrix} = \begin{pmatrix} 1 & -d\delta \frac{\sin\mu}{\beta} \\ 1 & 1 \end{pmatrix} \begin{pmatrix} \cos\mu + \alpha \sin\mu & \beta \sin\mu \\ -\frac{1 + \alpha^2}{\beta} \sin\mu & \cos\mu - \alpha \sin\mu \end{pmatrix}$$

(15)

By looking at the trace of $M'$ above we obtain:

$$2 \cos\mu' = 2 \cos\mu + \frac{1 + \alpha^2}{\beta} \sin\mu ds d\delta .$$

(16)

By putting $\mu' = \mu + d^2\mu$ into above:

$$d^2\mu = -\frac{1 + \alpha^2}{2\beta} ds d\delta , \text{ and } d\mu = -d\delta \int \frac{1 + \alpha^2}{2\beta} ds$$

(17)

by integrating over the ring. Thus the *natural chromaticity* is expressed as

$$\xi_{x,y} \equiv \frac{1}{2\pi} \frac{\partial \mu_{x,y}}{\partial \delta} = -\frac{1}{4\pi} \int \frac{1 + \alpha_{x,y}^2}{\beta_{x,y}} ds .$$

(18)

Note that $\xi_{x,y}$ is always negative.
Dipole magnet

A horizontally bending dipole magnet with a uniform magnetic field

\[ B = (0, B, 0), \quad B = \frac{P_d}{e\rho} \]  \hspace{1cm} (19)

has a Hamiltonian:
Dipole magnet

A horizontally bending dipole magnet with a uniform magnetic field

\[ \mathbf{B} = (0, B, 0), \quad B = \frac{P_d}{\epsilon \rho} \]  \hspace{1cm} (19)

has a Hamiltonian:

\[ H = -\left(1 + \frac{x}{\rho}\right)\sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} + \frac{1}{2} \left(1 + \frac{x}{\rho}\right)^2 + \frac{E}{v_d}. \]  \hspace{1cm} (20)

The equations of motion are:
Dipole magnet

A horizontally bending dipole magnet with a uniform magnetic field

\[ \mathbf{B} = (0, B, 0), \quad B = \frac{P_d}{e\rho} \]  

has a Hamiltonian:

\[ H = -\left(1 + \frac{x}{\rho}\right) \sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} + \frac{1}{2} \left(1 + \frac{x}{\rho}\right)^2 + \frac{E}{v_d} \quad (20) \]

The equations of motion are:

\[
\begin{align*}
H &= -(1 + x/\rho) \sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} - (1 + x/\rho) A_z + \frac{E}{v_d} \\
A_z &= -\frac{1}{2} \left(1 + \frac{x}{\rho}\right) \\
eB_y / P_d &= -\frac{1}{1 + x/\rho} \frac{\partial}{\partial x} [(1 + x/\rho)A_z] \\
&= \frac{1}{\rho}
\end{align*}
\]
Dipole magnet

A horizontally bending dipole magnet with a uniform magnetic field

\[ \mathbf{B} = (0, B, 0), \quad B = \frac{P_d}{e \rho} \]  \hfill (19)

has a Hamiltonian:

\[ H = -\left(1 + \frac{x}{\rho}\right) \sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} + \frac{1}{2} \left(1 + \frac{x}{\rho}\right)^2 + \frac{E}{v_d}. \]  \hfill (20)

The equations of motion are:

\[
\begin{align*}
\frac{dx}{ds} &= \frac{\partial H}{\partial p_x} = \frac{p_x}{p_z} \left(1 + \frac{x}{\rho}\right), \\
\frac{dy}{ds} &= \frac{\partial H}{\partial p_y} = \frac{p_y}{p_z} \left(1 + \frac{x}{\rho}\right), \\
\frac{dz}{ds} &= \frac{\partial H}{\partial \delta} = -\frac{1 + \delta}{p_z} \left(1 + \frac{x}{\rho}\right) + \frac{v}{v_d}, \\
\frac{dp_x}{ds} &= -\frac{\partial H}{\partial x} = \left(p_z - 1 - \frac{x}{\rho}\right) \frac{1}{\rho}, \\
\frac{dp_y}{ds} &= -\frac{\partial H}{\partial y} = 0, \\
\frac{d\delta}{ds} &= -\frac{\partial H}{\partial z} = 0.
\end{align*}
\]  \hfill (21)

For the variables defined above, the Hamiltonian is written as

\[ H = \left(1 + \frac{x}{\rho}\right) q \left(1 + \frac{x}{\rho}\right)^2 p_x^2 + \left(1 + \frac{x}{\rho}\right) A_z + \frac{E}{v_d}. \]  \hfill (3)

where \( \rho, \delta, \) and \( v_d \) are the bending radius, the torsion, and the design velocity, respectively, and

\[ E = \frac{c_q}{2} \left(1 + \frac{x}{\rho}\right)^2 \frac{m^2 c^2}{P_d^2} + \frac{1}{v} \]  \hfill (4)

is the (normalized) energy.

The bending radius and the torsion are associated with the coordinate system and not with the motion of particles. Thus usually we do not have to use the torsion \( \tau \), even if particles are doing helical motions.

The external fields are expressed by (normalized) electromagnetic potentials \((A_x, A_y, A_z, \tau)\), which are functions of \((x, y, z; s)\). In the case of magnets or RF cavities without a solenoid component \( B_z \), only \( A_z \) is necessary to express the field. In such cases the Hamiltonian is simplified to

\[ H = -\left(1 + \frac{x}{\rho}\right) \sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} - (1 + x/\rho)A_z + \frac{E}{v_d}. \]  \hfill (4)
Dipole magnet (2)

The motion in a uniform magnetic field is helical motion along the field line, which is in $y$-direction in this case. First we can derive

$$\frac{d^2 p_x}{ds^2} = -\frac{p_x}{\rho^2},$$  \hspace{1cm} (22)

then the solution has the form:

$$p_x = a \cos \phi + b \sin \phi,$$  \hspace{1cm} (23)

where $\phi = s / \rho$, and $a$ and $b$ are constants determined by the initial conditions.

Thus we obtain

$$p_x = p_x^0 \cos \phi + p_z^0 \frac{1}{v \rho} \sin \phi,$$  \hspace{1cm} (24)

by comparing with the initial values of $p_x$ and $dp_x/ds$.

Then we continue to obtain the solution of the other variables:

$$x = \rho \left( p_x^0 \sin \phi + p_z^0 \frac{1}{v \rho} \right),$$  \hspace{1cm} (25)

$$y = y_0 + \rho \phi,$$  \hspace{1cm} (26)

$$z = z_0 + \rho \left( 1 + \phi \right) + v \frac{d\phi}{d\rho},$$  \hspace{1cm} (27)

with the angle of the arc of the actual orbit:

$$\phi = \phi + \tan^{-1} \frac{p_x^0}{p_z^0} \tan^{-1} \frac{p_x^0}{p_z^0}.$$  \hspace{1cm} (28)
Dipole magnet (2)

The motion in a uniform magnetic field is helical motion along the field line, which is in y-direction in this case. First we can derive

\[
\frac{d^2 p_x}{ds^2} = -\frac{p_x}{\rho^2},
\]

(22)

from:

\[
\frac{dx}{ds} = \frac{\partial H}{\partial p_x} = \frac{p_z}{p_z} \left( 1 + \frac{x}{\rho} \right),
\]

\[
\frac{dp_x}{ds} = -\frac{\partial H}{\partial x} = \left( p_z - 1 - \frac{x}{\rho} \right) \frac{1}{\rho},
\]

\[
\frac{dy}{ds} = \frac{\partial H}{\partial p_y} = \frac{p_z}{p_z} \left( 1 + \frac{y}{\rho} \right),
\]

\[
\frac{dp_y}{ds} = \frac{\partial H}{\partial y} = 0,
\]

\[
\frac{dz}{ds} = \frac{\partial H}{\partial p_z} = \frac{1}{\rho},
\]

\[
\frac{dp_z}{ds} = \frac{\partial H}{\partial z} = 0.
\]

(23)

where \( s \) is the arc length and \( a \) and \( b \) are constants determined by the initial conditions.

Thus we obtain

\[
p_x = p_x(0) \cos(\theta) + p_z(0) \frac{1}{\rho}(1 - \frac{x}{\rho}) \frac{1}{\rho},
\]

(24)

by comparing with the initial values of \( p_x \) and \( dp_x/ds \).

Then we continue to obtain the solution of the other variables:

\[
x = p_x(0) \sin(\theta) - p_z(0) \frac{1}{\rho}(1 - \frac{x}{\rho}) \frac{1}{\rho},
\]

(25)

\[
y = y(0) + \frac{1}{\rho} p_y(0),
\]

(26)

\[
z = z(0) + \frac{1}{\rho} \left( 1 + \frac{x}{\rho} \right) \frac{1}{\rho},
\]

(27)

with the angle of the arc of the actual orbit:

\[
\theta = \theta(0) + \tan^{-1}\left( \frac{p_x(0)}{p_z(0)} \right).
\]

(28)

A dipole magnet with a uniform magnetic field

\[
B = \begin{pmatrix} 0, B_z, 0 \end{pmatrix},
\]

\[
B = \frac{eP}{d} \frac{1}{\rho},
\]

(19)

has a Hamiltonian:

\[
H = \frac{1}{2} + p_x \frac{1}{\rho} + \frac{1}{2} p_z \frac{1}{\rho} + \frac{1}{2} \left( p_x - 1 - \frac{x}{\rho} \right) \frac{1}{\rho},
\]

(20)

The equations of motion are:

\[
\frac{dx}{ds} = \frac{\partial H}{\partial p_x} = \frac{p_z}{p_z} \left( 1 + \frac{x}{\rho} \right),
\]

\[
\frac{dp_x}{ds} = -\frac{\partial H}{\partial x} = \left( p_z - 1 - \frac{x}{\rho} \right) \frac{1}{\rho},
\]

(21)

\[
\frac{dy}{ds} = \frac{\partial H}{\partial p_y} = \frac{p_z}{p_z} \left( 1 + \frac{y}{\rho} \right),
\]

\[
\frac{dp_y}{ds} = \frac{\partial H}{\partial y} = 0,
\]

(22)

\[
\frac{dz}{ds} = \frac{\partial H}{\partial p_z} = \frac{1}{\rho},
\]

\[
\frac{dp_z}{ds} = \frac{\partial H}{\partial z} = 0.
\]

(23)
Dipole magnet (2)

The motion in a uniform magnetic field is helical motion along the field line, which is in $y$-direction in this case. First we can derive

$$\frac{d^2 p_x}{ds^2} = -\frac{p_x}{\rho^2}, \quad (22)$$

then the solution has the form:

$$p_x = a \cos \theta + b \sin \theta, \quad (23)$$

where $\theta \equiv s/\rho$, and $a$ and $b$ are constants determined by the initial conditions.
Dipole magnet (2)

The motion in a uniform magnetic field is helical motion along the field line, which is in $y$-direction in this case. First we can derive

$$\frac{d^2 p_x}{ds^2} = -\frac{p_x}{\rho^2}, \quad (22)$$

then the solution has the form:

Dipole magnet (3)

The transfer matrix for a flat dipole can be obtained by differentiating above. For an on-axis particle \((x_0, p_{x0}, y_0, p_{y0}) = (0, 0, 0, 0)\) with a small bending angle \(\theta \ll 1\), it is written as
Dipole magnet (3)

The transfer matrix for a flat dipole can be obtained by differentiating above. For an on-axis particle \((x_0, p_{x0}, y_0, p_{y0}) = (0, 0, 0, 0)\) with a small bending angle \(\theta \ll 1\), it is written as

\[
M = \begin{pmatrix}
1 & \frac{L}{1 + \delta} & \cdots & \frac{L\theta}{2(1 + \delta)^2} \\
& \frac{1}{1 + \delta} & \cdots & \\
& \cdots & \frac{L}{1 + \delta} & \\
& \cdots & \cdots & 1 \\
-\theta & \frac{-L\theta(1 + 2\delta)}{2(1 + \delta)^2} & \cdots & 1 \\
& \cdots & \cdots & \frac{v - v_d L}{v_d}
\end{pmatrix} + O(\theta)^2, \quad (29)
\]

\[
x = \rho \left\{ p_{x0} \sin \theta - \left( p_{z0} - 1 - \frac{x_0}{\rho} \right) \cos \theta + p_z - 1 \right\}, \quad (25)
\]

\[
y = y_0 + \rho \omega p_{y0}, \quad (26)
\]

\[
z = z_0 - \rho (\omega(1 + \delta) - \theta) + \frac{v}{v_d} \rho \theta \quad (27)
\]
The transfer matrix for a flat dipole can be obtained by differentiating above. For an on-axis particle \((x_0, p_{x0}, y_0, p_{y0}) = (0, 0, 0, 0)\) with a small bending angle \(\theta \ll 1\), it is written as

\[
M = \begin{pmatrix}
1 & \frac{L}{1 + \delta} & \cdots & \frac{L\theta}{2(1 + \delta)^2} \\
\vdots & \ddots & \ddots & \vdots \\
-\theta & -\frac{L\theta(1 + 2\delta)}{2(1 + \delta)^2} & \ddots & \frac{\nu - \nu_d}{\nu_d} \\
\vdots & \ddots & \ddots & \frac{L}{1 + \delta}
\end{pmatrix} + O(\theta)^2, \tag{29}
\]

where \(L \equiv \rho \theta\). If we compare this with the transfer matrix for a drift, the differences are the non-zero \(M_{16}, M_{26}, M_{51}, M_{52}\) components, which are related to dispersions, and will be discussed later.
Dipole magnet (3)

The transfer matrix for a flat dipole can be obtained by differentiating above. For an on-axis particle \((x_0, p_{x0}, y_0, p_{y0}) = (0, 0, 0, 0)\) with a small bending angle \(\theta \ll 1\), it is written as

\[
M = \begin{pmatrix}
1 & \frac{L}{1 + \delta} & \cdot & \cdot & \frac{L\theta}{2(1 + \delta)^2} \\
\cdot & 1 & \frac{L}{1 + \delta} & \cdot & \cdot \\
\cdot & \cdot & 1 & \frac{L\theta(1 + 2\delta)}{2(1 + \delta)^2} & \cdot \\
-\theta & -\frac{L\theta(1 + 2\delta)}{2(1 + \delta)^2} & \cdot & 1 & \frac{v - v_d}{v_d}L \\
\cdot & \cdot & \cdot & \cdot & 1
\end{pmatrix} + O(\theta)^2, \tag{29}
\]

where \(L \equiv \rho\theta\). If we compare this with the transfer matrix for a drift, the differences are the non-zero \(M_{16}, M_{26}, M_{51}, M_{52}\) components, which are related to dispersions, and will be discussed later.

Except for these terms, the transfer matrix of a flat, small-bending dipole is just equal to that of the drift space with the length \(L\), including the chromatic behavior.
Thin multipole magnets

A $2n$-pole multipole magnet has a magnetic field

$$B_x + iB_y = \frac{B_n}{(n-1)!} (x + iy)^{n-1}.$$  \hfill (30)

The associated Hamiltonian is

$$H = (1 + x^2 + y^2) p^2 + K_n(x + iy)^n.$$ \hfill (31)

There is no analytic solution of the motion with the Hamiltonian above, due to the $p$ term. The simplest way of approximations is to concentrate the field into a thin lens. In this case the resulting Hamiltonian with the thin field at $s = 0$ is expressed as

$$H = k_n (x + iy)^n.$$ \hfill (32)

where

$$k_n = \int K_n ds = K_n L.$$ \hfill (33)
Thin multipole magnets

A 2n-pole multipole magnet has a magnetic field

\[ B_x + iB_y = \frac{B_n}{(n-1)!} (x + iy)^{n-1}. \]  

The associated Hamiltonian is

\[ H = -\sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} + \frac{K_{n-1}}{n!} (x + iy)^n + \frac{E}{v_d}, \]

where \( K_{n-1} = \frac{1}{B \rho} \frac{d^{n-1} B_y}{dx^{n-1}}. \)
Thin multipole magnets

A 2n-pole multipole magnet has a magnetic field

\[ B_x + iB_y = \frac{B_n}{(n - 1)!} (x + iy)^{n-1}. \]

(30)

The associated Hamiltonian is

\[ H = -\sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} + \frac{K_{n-1}}{n!} (x + iy)^n + \frac{E}{v_d}, \]

(31)

where \( K_{n-1} = \frac{1}{B\rho} \frac{d^{n-1}B_y}{dx^{n-1}}. \)

There is no analytic solution of the motion with the Hamiltonian above, due to the \( \sqrt{ } \) term. The simple way of approximations is to concentrate the field into a \textit{thin lens}. In this case the resulting Hamiltonian with the thin field at \( s = 0 \) is expressed as

\[ H = \frac{k_{n-1}}{n!} (x + iy)^n \delta(s), \]

(32)

where

\[ k_{n-1} \]
Thin multipole magnets

A $2n$-pole multipole magnet has a magnetic field

$$B_x + iB_y = \frac{B_n}{(n-1)!} (x + iy)^{n-1}.$$  \hspace{1cm} (30)

The associated Hamiltonian is

$$H = -\sqrt{(1 + \delta)^2 - p_x^2 - p_y^2} + \frac{K_{n-1}}{n!} (x + iy)^n + \frac{E}{v_d},$$  \hspace{1cm} (31)

where $K_{n-1} = \frac{1}{B\rho} \frac{d^{n-1}B_y}{ds^n}$.  \hspace{1cm} (33)

There is no analytic solution of the motion with the Hamiltonian above, due to the $\sqrt{}$ term. The simplest way of approximations is to concentrate the field into a thin lens. In this case the resulting Hamiltonian with the thin field at $s = 0$ is expressed as

$$H = \frac{k_{n-1}}{n!} (x + iy)^n \delta(s),$$  \hspace{1cm} (32)

where

$$k_{n-1} \equiv \int K_{n-1} ds \approx K_{n-1} L.$$  \hspace{1cm} (33)
Thin multipole magnets (2)

Then the solution is

\[ p_x + ip_y = p_{x0} + ip_{y0} - \frac{k_{n-1}}{(n-1)!}(x_0 + iy_0)^{n-1}, \]  

(34)

\[ x = x_0, \quad y = y_0, \quad z = z_0, \quad \delta = \delta_0. \]  

(35)
Thin multipole magnets (2)

Then the solution is

\[ p_x + i p_y = p_{x0} + i p_{y0} - \frac{k_{n-1}}{(n-1)!} (x_0 + i y_0)^{n-1}, \]  
\[ x = x_0, \quad y = y_0, \quad z = z_0, \quad \delta = \delta_0. \]  

Note that the transformation is independent on \( \delta \), which means there is no chromaticity in a thin multipole.

Then the associated transfer matrix is written as
Thin multipole magnets (2)

Then the solution is

\[ p_x + ip_y = p_{x0} + ip_{y0} - \frac{k_{n-1}}{(n-1)!} (x_0 + iy_0)^{n-1} , \]  

(34)

\[ x = x_0, \quad y = y_0, \quad z = z_0, \quad \delta = \delta_0 . \]  

(35)

Note that the transformation is independent on \( \delta \), which means there is no chromaticity in a thin multipole.

Then the associated transfer matrix is written as

\[
M = \begin{pmatrix}
1 & & & & \\
-\Re\left( \frac{k_{n-1}}{(n-2)!} (x_0 + iy_0)^{n-2} \right) & 1 & & & \\
& & 1 & & \\
\mathcal{F}\left( \frac{ik_{n-1}}{(n-2)!} (x_0 + iy_0)^{n-2} \right) & & 1 & \\
& & & & 1 \\
& & & & 1 \\
\end{pmatrix}
\]  

(36)
Thin quadrupole magnet

In the case of a quadrupole, $M$ is obtained by setting $n = 2$ in Eq. (36):

$$M = \begin{pmatrix}
1 & \cdot & \cdot & \cdot & \cdot \\
-k_1 & 1 & \cdot & \cdot & \cdot \\
\cdot & \cdot & 1 & \cdot & \cdot \\
\cdot & \cdot & k_1 & 1 & \cdot \\
\cdot & \cdot & \cdot & \cdot & 1
\end{pmatrix}, \quad (37)$$

where we have assumed $k_1$ is real.
Thin quadrupole magnet

In the case of a quadrupole, \( M \) is obtained by setting \( n = 2 \) in Eq. (36):

\[
M = \begin{pmatrix}
1 & \cdot & \cdot & \cdot & \cdot \\
-k_1 & 1 & \cdot & \cdot & \cdot \\
\cdot & \cdot & 1 & \cdot & \cdot \\
\cdot & \cdot & k_1 & 1 & \cdot \\
\cdot & \cdot & \cdot & \cdot & 1
\end{pmatrix},
\]

where we have assumed \( k_1 \) is real.

The physical meaning of above is that \( k_1 \) is the inverse of the focal length of the thin quadrupole.
Thin quadrupole magnet

In the case of a quadrupole, $M$ is obtained by setting $n = 2$ in Eq. (36):

$$M = \begin{pmatrix} 1 & \cdot & \cdot & \cdot & \cdot \\ -k_1 & 1 & \cdot & \cdot & \cdot \\ \cdot & 1 & \cdot & \cdot & \cdot \\ \cdot & \cdot & k_1 & 1 & \cdot \\ \cdot & \cdot & \cdot & 1 & \cdot \\ \cdot & \cdot & \cdot & \cdot & 1 \end{pmatrix},$$

(37)

where we have assumed $k_1$ is real.

The physical meaning of above is that $k_1$ is the inverse of the focal length of the thin quadrupole.
A thin accelerating RF cavity can be expressed by a Hamiltonian, consisting of only $A_z$:

$$H = \frac{eV_c}{cP_d\omega_{RF}} \cos \left( -\omega_{RF} \frac{z}{v} + \phi_{RF} \right) \delta(s)$$

(38)

$$= \frac{eV_c}{cP_d\omega_{RF}} \cos \left( \omega_{RF}(t - t_{0RF}) + \phi_{RF} \right) \delta(s) ,$$

(39)

The resulting transformation for the RF cavity is:

$$E = E_0 + \frac{eV_c}{cP_d\omega_{RF}} \sin \left( -\omega_{RF} \frac{z}{v} + \phi_{RF} \right) \delta(s)$$

(40)

and the change of $z$ and $t$ are calculated from their definitions:

$$E^2 = m^2 c^4 p^2 d + (1 + \gamma)^2 ,$$

$$z = \frac{1}{\gamma} E c \left( t - t_{0RF} \right)$$

(41)

Since the RF cavity is expressed by Hamiltonian, the emittance is preserved in each plane.
RF cavity

A thin accelerating RF cavity can be expressed by a Hamiltonian, consisting of only $A_z$:

$$H = \frac{eV_c}{cP_d\omega_{RF}} \cos \left( -\omega_{RF} \frac{z}{v} + \phi_{RF} \right) \delta(s) \quad (38)$$

$$= \frac{eV_c}{cP_d\omega_{RF}} \cos \left( \omega_{RF}(t - t_{0RF}) + \phi_{RF} \right) \delta(s) \quad (39)$$

where $V_c$, $\omega_{RF}$, $\phi_{RF}$, and $t_{0RF}$ are the peak accelerating voltage, angular frequency, RF phase, and the design arrival time of the cavity.

The resulting transformation for the RF cavity is:
RF cavity

A thin accelerating RF cavity can be expressed by a Hamiltonian, consisting of only $A_z$:

$$H = \frac{eV_c}{cP_d\omega_{RF}} \cos \left( -\omega_{RF} \frac{z}{v} + \phi_{RF} \right) \delta(s)$$  \hspace{1cm} (38)

$$= \frac{eV_c}{cP_d\omega_{RF}} \cos \left( \omega_{RF}(t - t_{0RF}) + \phi_{RF} \right) \delta(s) , \hspace{1cm} (39)$$

where $V_c$, $\omega_{RF}$, $\phi_{RF}$, and $t_{0RF}$ are the peak accelerating voltage, angular frequency, RF phase, and the design arrival time of the cavity.

The resulting transformation for the RF cavity is:

$$E = E_0 + \frac{eV_c}{cP_d} \sin \left( -\omega_{RF} \frac{z}{v} + \phi_{RF} \right) , \hspace{1cm} (40)$$
RF cavity

A thin accelerating RF cavity can be expressed by a Hamiltonian, consisting of only $A_z$:

$$H = \frac{eV_c}{cP_d\omega_{RF}} \cos\left(\frac{\omega_{RF} z}{v} + \phi_{RF}\right) \delta(s)$$  \hspace{1cm} (38)

$$= \frac{eV_c}{cP_d\omega_{RF}} \cos\left(\omega_{RF}(t - t_{0RF}) + \phi_{RF}\right) \delta(s),$$  \hspace{1cm} (39)

where $V_c$, $\omega_{RF}$, $\phi_{RF}$, and $t_{0RF}$ are the peak accelerating voltage, angular frequency, RF phase, and the design arrival time of the cavity.

The resulting transformation for the RF cavity is:

$$E = E_0 + \frac{eV_c}{cP_d} \sin\left(-\omega_{RF} \frac{z}{v} + \phi_{RF}\right),$$  \hspace{1cm} (40)

and the change of $z$, and $\delta$ are calculated from their definitions:

$$E^2 = \frac{m^2 c^4}{c^2 p_d^2} + (1 + \delta)^2 , \hspace{1cm} z = -\frac{1 + \delta}{E} c(t - t_{0RF}).$$  \hspace{1cm} (41)
RF cavity

A thin accelerating RF cavity can be expressed by a Hamiltonian, consisting of only $A_z$:

$$H = \frac{eV_c}{cP_d\omega_{RF}} \cos \left( -\omega_{RF} \frac{z}{v} + \phi_{RF} \right) \delta(s) \tag{38}$$

$$= \frac{eV_c}{cP_d\omega_{RF}} \cos \left( \omega_{RF}(t - t_{0RF}) + \phi_{RF} \right) \delta(s), \tag{39}$$

where $V_c$, $\omega_{RF}$, $\phi_{RF}$, and $t_{0RF}$ are the peak accelerating voltage, angular frequency, RF phase, and the design arrival time of the cavity.

The resulting transformation for the RF cavity is:

$$E = E_0 + \frac{eV_c}{cP_d} \sin \left( -\omega_{RF} \frac{z}{v} + \phi_{RF} \right), \tag{40}$$

and the change of $z$, and $\delta$ are calculated from their definitions:

$$E^2 = \frac{m^2c^4}{c^2p^2_d} + (1 + \delta)^2, \quad z = -\frac{1 + \delta}{E} c(t - t_{0RF}). \tag{41}$$

Since the RF cavity is expressed by Hamiltonian, the emittance is preserved in each plane.

\begin{pmatrix}
1 & 0 \\
\mp k_F/2 & 1
\end{pmatrix}
\]

\[
= \begin{pmatrix}
1 & (k_D - k_F)L - k_Fk_D L^2/2 \\
\pm(k_D - k_F) - k_Fk_D L + k_F^2L(1 \pm k_D L/2)/2 & 1 & (k_D - k_F)L - k_Fk_D L^2/2
\end{pmatrix}
\]

\[
= \begin{pmatrix}
1 & (c_D - c_F) - \frac{c_D c_F}{2} \\
\pm(c_D - c_F) - c_Fc_D + c_F^2(1 \pm c_D /2) & 1 & (c_D - c_F) - \frac{c_F c_D}{2}
\end{pmatrix}
\]

where $L$ is the length between quads, and $k_F$, $k_D$ are the focusing strengths of $Q_F$ and $Q_D$, respectively.

We have used the thin-lens approximation for the quadrupoles, and introduced dimensionless parameters $c_{F,D} \equiv k_{F,D}L$. We assume $c_{F,D} > 0$. 

FODO cell (2)
If the beam optics is periodic, the transfer matrix above must be equal to

\[
M_{x,y} = \begin{pmatrix}
\cos \mu_{x,y} + \alpha_{x,y} \sin \mu_{x,y} & \beta_{x,y} \sin \mu_{x,y} \\
1 + \alpha_{x,y}^2 \sin \mu_{x,y} & \cos \mu_{x,y} - \alpha_{x,y} \sin \mu_{x,y}
\end{pmatrix}.
\]  

(45)
Let us consider the on-axis, on-momentum transfer matrix $M$ of a FODO cell.

We have used the thin-lens approximation for the quadrupoles, and introduced dimensionless parameters $\alpha_x$, $\beta_x$, and $\gamma_x$.

For the time being, we consider the 2 by 2 part for each section of the cell, and the $\pm$ parts will be discussed later.

Then once the phase advances between the midpoints of QF as $\pm D_{\pm k} L$, respectively.

The $\pm$-function at QF is obtained by Eq. (48). Note that $0 < \alpha_x < 1$.

If the beam optics is periodic, the transfer matrix above must be equal to

$$M_{x,y} = \begin{pmatrix} \cos \mu_{x,y} + \alpha_{x,y} \sin \mu_{x,y} & \beta_{x,y} \sin \mu_{x,y} \\ \frac{1 + \alpha_{x,y}^2}{\beta_{x,y}} \sin \mu_{x,y} & \cos \mu_{x,y} - \alpha_{x,y} \sin \mu_{x,y} \end{pmatrix}.$$  (45)
If the beam optics is periodic, the transfer matrix above must be equal to

\[
M_{x,y} = \begin{pmatrix}
cos \mu_{x,y} + \alpha_{x,y} \sin \mu_{x,y} & \beta_{x,y} \sin \mu_{x,y} \\
1 + \frac{\alpha_{x,y}^2}{\beta_{x,y}} \sin \mu_{x,y} & cos \mu_{x,y} - \alpha_{x,y} \sin \mu_{x,y}
\end{pmatrix}.
\] (45)

By comparing two expressions, we obtain the values of the Twiss parameters at the center of QF as
If the beam optics is periodic, the transfer matrix above must be equal to

\[
M_{x,y} = \begin{pmatrix}
\cos \mu_{x,y} + \alpha_{x,y} \sin \mu_{x,y} & \beta_{x,y} \sin \mu_{x,y} \\
1 + \alpha_{x,y}^2 \sin \mu_{x,y} & \beta_{x,y} \sin \mu_{x,y} - \alpha_{x,y} \sin \mu_{x,y}
\end{pmatrix}.
\tag{45}
\]

By comparing two expressions, we obtain the values of the Twiss parameters at the center of QF as

\[
\alpha_{x,y} = 0,
\tag{46}
\]
Let us consider the on-axis, on-momentum transfer matrix $M$ of a FODO cell, $M = L/(2 \pm c_D)$, respectively. $B$ is the length between quads, and $c_F, c_D$ are the focusing strengths of QF and DQ, respectively. We assume $D > 0$.

If the beam optics is periodic, the transfer matrix above must be equal to

$$M_{x,y} = \begin{pmatrix}
\cos \mu_{x,y} + \alpha_{x,y} \sin \mu_{x,y} & \beta_{x,y} \sin \mu_{x,y} \\
1 + \alpha_{x,y}^2 \sin \mu_{x,y} & \cos \mu_{x,y} - \alpha_{x,y} \sin \mu_{x,y}
\end{pmatrix}. \quad (45)
$$

By comparing two expressions, we obtain the values of the Twiss parameters at the center of QF as

$$\alpha_{x,y} = 0, \quad (46)$$

$$\cos \mu_{x,y} = 1 + (c_{D,F} - c_{F,D}) - \frac{c_F c_D}{2}, \quad (47)$$
If the beam optics is periodic, the transfer matrix above must be equal to

\[
M_{x,y} = \begin{pmatrix}
\cos \mu_{x,y} + \alpha_{x,y} \sin \mu_{x,y} & \beta_{x,y} \sin \mu_{x,y} \\
1 + \alpha_{x,y}^2 \sin \mu_{x,y} & \cos \mu_{x,y} - \alpha_{x,y} \sin \mu_{x,y}
\end{pmatrix}.
\]  

(45)

By comparing two expressions, we obtain the values of the Twiss parameters at the center of QF as

\[
\alpha_{x,y} = 0 ,
\]  

(46)  

\[
\cos \mu_{x,y} = 1 + (c_{D,F} - c_{F,D}) - \frac{c_{F}c_{D}}{2} ,
\]  

(47)  

\[
\beta_{x,y} = \frac{2 \pm c_{D}}{\sin \mu_{x,y}} L .
\]  

(48)
If the beam optics is periodic, the transfer matrix above must be equal to

$$
M_{x,y} = \begin{pmatrix}
\cos \mu_{x,y} + \alpha_{x,y} \sin \mu_{x,y} & \beta_{x,y} \sin \mu_{x,y} \\
\frac{1 + \alpha_{x,y}^2}{\beta_{x,y}} \sin \mu_{x,y} & \cos \mu_{x,y} - \alpha_{x,y} \sin \mu_{x,y}
\end{pmatrix}.
$$

(45)

By comparing two expressions, we obtain the values of the Twiss parameters at the center of QF as

$$
\alpha_{x,y} = 0,
$$

(46)

$$
\cos \mu_{x,y} = 1 + (c_{D,F} - c_{F,D}) - \frac{c_{F,D}}{2},
$$

(47)

$$
\beta_{x,y} = \frac{2 \pm c_D}{\sin \mu_{x,y}} L.
$$

(48)

Then once the phase advances $\mu_{x,y}$ are given, parameters $c_{F,D}$ are determined as

$$
c_F = \frac{1}{4} \left( \cos \mu_y - \cos \mu_x + \sqrt{32 - 16(\cos \mu_x + \cos \mu_y) + (\cos \mu_x - \cos \mu_y)^2} \right),
$$

(49)

$$
c_D = \frac{1}{4} \left( \cos \mu_x - \cos \mu_y + \sqrt{32 - 16(\cos \mu_x + \cos \mu_y) + (\cos \mu_x - \cos \mu_y)^2} \right),
$$

(50)
FODO cell (3)

If the beam optics is periodic, the transfer matrix above must be equal to

\[
M_{x,y} = \begin{pmatrix}
\cos \mu_{x,y} + \alpha_{x,y} \sin \mu_{x,y} & \beta_{x,y} \sin \mu_{x,y} \\
\frac{1 + \alpha_{x,y}^2}{\beta_{x,y}} \sin \mu_{x,y} & \cos \mu_{x,y} - \alpha_{x,y} \sin \mu_{x,y}
\end{pmatrix}.
\] (45)

By comparing two expressions, we obtain the values of the Twiss parameters at the center of QF as

\[
\alpha_{x,y} = 0, \quad \text{(46)}
\]

\[
\cos \mu_{x,y} = 1 + (c_{D,F} - c_{F,D}) - \frac{c_F c_D}{2}, \quad \text{(47)}
\]

\[
\beta_{x,y} = \frac{2 \pm c_D}{\sin \mu_{x,y}} L. \quad \text{(48)}
\]

Then once the phase advances \(\mu_{x,y}\) are given, parameters \(c_{F,D}\) are determined as

\[
c_F = \frac{1}{4} \left( \cos \mu_y - \cos \mu_x + \sqrt{32 - 16(\cos \mu_x + \cos \mu_y) + (\cos \mu_x - \cos \mu_y)^2} \right), \quad \text{(49)}
\]

\[
c_D = \frac{1}{4} \left( \cos \mu_x - \cos \mu_y + \sqrt{32 - 16(\cos \mu_x + \cos \mu_y) + (\cos \mu_x - \cos \mu_y)^2} \right), \quad \text{(50)}
\]

The value of \(\beta\)-function at QF is obtained by Eq. (48). Note that \(0 < C_{F,D} < 2\).
Dependence of FODO cell parameters on $\mu_{x,y}$
Dependence of FODO cell parameters on \( \mu_{x,y} \)
Dependence of FODO cell parameters on $\mu_{x,y}$

\[ \beta_x = \frac{2 + c_D L}{\sin \mu_x} \]
Dependence of FODO cell parameters on $\mu_{x,y}$
Twiss parameters along a beam line

Once we have the Twiss parameters $\alpha_1, \beta_1$ at a particular location $s = s_1$ in a beam line, the 2 by 2 transfer matrix $M$ from $s_1$ to $s$ is expressed as

\[
M = \left[ \begin{pmatrix} 1 & 0 \\ \alpha(s) & 1 \end{pmatrix} \begin{pmatrix} \sqrt{\beta(s)} & 0 \\ 0 & \sqrt{\beta(s)} \end{pmatrix} \right]^{-1} 
\times \begin{pmatrix} \cos \phi(s) & \sin \phi(s) \\ -\sin \phi(s) & \cos \phi(s) \end{pmatrix} \times \left[ \begin{pmatrix} 1 & 0 \\ \alpha_1 & 1 \end{pmatrix} \begin{pmatrix} \sqrt{\beta_1} & 0 \\ 0 & \sqrt{\beta_1} \end{pmatrix} \right]
\]

where $\alpha(s), \beta(s), \phi = \phi(s)$ are the Twiss parameters at $s$ and the phase advance from $s_1$ to $s$, respectively.
Twiss parameters along a beam line

Once we have the Twiss parameters $\alpha_1, \beta_1$ at a particular location $s = s_1$ in a beam line, the 2 by 2 transfer matrix $M$ from $s_1$ to $s$ is expressed as

$$M = \left[ \begin{array}{cc} \frac{1}{\sqrt{\beta(s)}} & 0 \\ \alpha(s) & 1 \end{array} \right] \left[ \begin{array}{cc} 0 & \sqrt{\beta(s)} \\ 0 & 0 \end{array} \right]^{-1} \times \left[ \begin{array}{cc} \cos \phi(s) & \sin \phi(s) \\ -\sin \phi(s) & \cos \phi(s) \end{array} \right] \times \left[ \begin{array}{cc} 0 & \frac{1}{\sqrt{\beta_1}} \\ 0 & 0 \end{array} \right]$$

where $\alpha(s)$, $\beta(s)$, and $\phi = \phi(s)$ are the Twiss parameters at $s$ and the phase advance from $s_1$ to $s$, respectively.
Twiss parameters along a beam line

Once we have the Twiss parameters $\alpha_1, \beta_1$ at a particular location $s = s_1$ in a beam line, the 2 by 2 transfer matrix $M$ from $s_1$ to $s$ is expressed as

$$M = \left[ \begin{array}{cc} 1 & 0 \\ \alpha(s) & 1 \end{array} \right] \left[ \begin{array}{cc} 1/\sqrt{\beta(s)} & 0 \\ 0 & \sqrt{\beta(s)} \end{array} \right]^{-1} \times \left[ \begin{array}{cc} \cos \phi(s) & \sin \phi(s) \\ -\sin \phi(s) & \cos \phi(s) \end{array} \right] \times \left[ \begin{array}{cc} 1 & 0 \\ \alpha_1 & 1 \end{array} \right] \left[ \begin{array}{cc} 1/\sqrt{\beta_1} & 0 \\ 0 & \sqrt{\beta_1} \end{array} \right]$$

where $\alpha(s), \beta(s), \text{ and } \phi = \phi(s)$ are the Twiss parameters at $s$ and the phase advance from $s_1$ to $s$, respectively.
Twiss parameters along a beam line

Once we have the Twiss parameters $\alpha_1, \beta_1$ at a particular location $s = s_1$ in a beam line, the 2 by 2 transfer matrix $M$ from $s_1$ to $s$ is expressed as

\[
M = \left[ \begin{array}{cc}
1 & 0 \\
\alpha(s) & 1
\end{array} \right] \left[ \begin{array}{cc}
1/\sqrt{\beta(s)} & 0 \\
0 & \sqrt{\beta(s)}
\end{array} \right]^{-1} \times \left[ \begin{array}{cc}
\cos \phi(s) & \sin \phi(s) \\
-\sin \phi(s) & \cos \phi(s)
\end{array} \right] \times \left[ \begin{array}{cc}
1 & 0 \\
\alpha_1 & 1
\end{array} \right] \left[ \begin{array}{cc}
1/\sqrt{\beta_1} & 0 \\
0 & \sqrt{\beta_1}
\end{array} \right],
\]

where $\alpha(s), \beta(s)$, and $\phi = \phi(s)$ are the Twiss parameters at $s$ and the phase advance from $s_1$ to $s$, respectively.
Twiss parameters along a beam line

Once we have the Twiss parameters $\alpha_1, \beta_1$ at a particular location $s = s_1$ in a beam line, the 2 by 2 transfer matrix $M$ from $s_1$ to $s$ is expressed as

$$M = \left[ \begin{array}{cc} 1 & 0 \\ \alpha(s) & 1 \end{array} \right] \left[ \begin{array}{cc} 1/\sqrt{\beta(s)} & 0 \\ 0 & \sqrt{\beta(s)} \end{array} \right]^{-1} \times \left( \begin{array}{cc} \cos \phi(s) & \sin \phi(s) \\ -\sin \phi(s) & \cos \phi(s) \end{array} \right) \times \left[ \begin{array}{cc} 1 & 0 \\ \alpha_1 & 1 \end{array} \right] \left[ \begin{array}{cc} 1/\sqrt{\beta_1} & 0 \\ 0 & \sqrt{\beta_1} \end{array} \right]$$

$$= \begin{pmatrix} \sqrt{\beta(s)/\beta_1} (\cos \phi + \alpha_1 \sin \phi) & \sqrt{\beta(s)\beta_1} \sin \phi \\ -(1 + \alpha(s)\alpha_1) \sin \phi + (\alpha(s) - \alpha_1) \cos \phi & \sqrt{\beta(s)/\beta_1} (\cos \phi - \alpha(s) \sin \phi) \end{pmatrix}, \quad (51)$$

where $\alpha(s), \beta(s),$ and $\phi = \phi(s)$ are the Twiss parameters at $s$ and the phase advance from $s_1$ to $s$, respectively.
Once we have the Twiss parameters $\alpha_1, \beta_1$ at a particular location $s = s_1$ in a beam line, the 2 by 2 transfer matrix $M$ from $s_1$ to $s$ is expressed as

$$M = \left[ \begin{array}{cc} 1 & 0 \\ \alpha(s) & 1 \end{array} \right] \left[ \begin{array}{cc} 1/\sqrt{\beta(s)} & 0 \\ 0 & \sqrt{\beta(s)} \end{array} \right]^{-1} \times \left[ \begin{array}{cc} \cos \phi(s) & \sin \phi(s) \\ -\sin \phi(s) & \cos \phi(s) \end{array} \right] \times \left[ \begin{array}{cc} 1 & 0 \\ \alpha_1 & 1 \end{array} \right] \left[ \begin{array}{cc} 1/\sqrt{\beta_1} & 0 \\ 0 & \sqrt{\beta_1} \end{array} \right]$$

where $\alpha(s), \beta(s)$, and $\phi = \phi(s)$ are the Twiss parameters at $s$ and the phase advance from $s_1$ to $s$, respectively.

The above means that a symplectic motion is reduced to a circular motion in the normalized phase space:

$$(u, p_u) = \left( \frac{x}{\sqrt{\beta}}, \ p_x \sqrt{\beta} + x \frac{\alpha}{\sqrt{\beta}} \right). \quad (52)$$
Twiss parameters along a beam line

Once we have the Twiss parameters $\alpha_1, \beta_1$ at a particular location $s = s_1$ in a beam line, the 2 by 2 transfer matrix $M$ from $s_1$ to $s$ is expressed as

$$= \left( \frac{\sqrt{\beta(s)}}{\sqrt{\beta_1}} \frac{\beta(s)}{\beta_1} \right) \left( \begin{array}{cc} \cos \phi + \alpha_1 \sin \phi & \sqrt{\beta_1} \sin \phi \\ -(1 + \alpha(s)\alpha_1) \sin \phi + (\alpha(s) - \alpha_1) \cos \phi & \sqrt{\beta(s)} \beta_1 \sin \phi \end{array} \right) \frac{\sqrt{\beta_1}}{\sqrt{\beta(s)}} \left( \begin{array}{c} \cos \phi - \alpha(s) \sin \phi \\ \sqrt{\beta(s)} \beta_1 \sin \phi \end{array} \right), \quad (51)$$

where $\alpha(s)$, $\beta(s)$, and $\phi = \phi(s)$ are the Twiss parameters at $s$ and the phase advance from $s_1$ to $s$, respectively.

The above means that a symplectic motion is reduced to a circular motion in the normalized phase space:

$$(u, p_u) = \left( \frac{x}{\sqrt{\beta}}, \ p_x \sqrt{\beta} + x \frac{\alpha}{\sqrt{\beta}} \right). \quad (52)$$
Twiss parameters along a beam line

Once we have the Twiss parameters $\alpha_1, \beta_1$ at a particular location $s = s_1$ in a beam line, the 2 by 2 transfer matrix $M$ from $s_1$ to $s$ is expressed as

$$M = \left[ \begin{array}{cc} 1 & 0 \\ \alpha(s) & 1 \end{array} \right] \left[ \begin{array}{cc} 1/\sqrt{\beta(s)} & 0 \\ 0 & \sqrt{\beta(s)} \end{array} \right]^{-1} \times \left[ \begin{array}{cc} \cos \phi(s) & \sin \phi(s) \\ -\sin \phi(s) & \cos \phi(s) \end{array} \right] \times \left[ \begin{array}{cc} 1 & 0 \\ \alpha_1 & 1 \end{array} \right] \left[ \begin{array}{cc} 1/\sqrt{\beta_1} & 0 \\ 0 & \sqrt{\beta_1} \end{array} \right]$$

$$= \frac{\sqrt{\beta(s)}}{\beta_1} (\cos \phi + \alpha_1 \sin \phi) \quad \frac{\sqrt{\beta(s) \beta_1}}{\beta_1} \sin \phi$$

$$- \frac{(1 + \alpha(s) \alpha_1) \sin \phi + (\alpha(s) - \alpha_1) \cos \phi}{\sqrt{\beta(s) \beta_1}} \sqrt{\frac{1}{\beta_1}} \sin \phi$$

$$= \frac{\sqrt{\beta(s)}}{\beta_1} (\cos \phi - \alpha(s) \sin \phi) \quad \frac{\sqrt{\beta(s) \beta_1}}{\beta_1} \sin \phi$$

(51)

where $\alpha(s), \beta(s)$, and $\phi = \phi(s)$ are the Twiss parameters at $s$ and the phase advance from $s_1$ to $s$, respectively.

The above means that a symplectic motion is reduced to a circular motion in the normalized phase space:

$$(u, p_u) = \left( \frac{x}{\sqrt{\beta}}, \ p_x \sqrt{\beta} + x \frac{\alpha}{\sqrt{\beta}} \right).$$

(52)
Twiss parameters along a beam line (2)

If we know the transfer matrix from $s_1$ to $s$

$$M(s) = \begin{pmatrix} M_{11} & M_{12} \\ M_{21} & M_{22} \end{pmatrix} , \tag{53}$$

we can calculate the Twiss parameters at $s$ using Eq, (51) as
Twiss parameters along a beam line (2)

If we know the transfer matrix from \( s_1 \) to \( s \)

\[
M(s) = \begin{pmatrix}
M_{11} & M_{12} \\
M_{21} & M_{22}
\end{pmatrix},
\]  

(53)

we can calculate the Twiss parameters at \( s \) using Eq, (51) as

\[
\begin{pmatrix}
\sqrt{\frac{\beta(s)}{\beta_1}} (\cos \phi + \alpha_1 \sin \phi) \\
- \frac{(1 + \alpha(s)\alpha_1) \sin \phi + (\alpha(s) - \alpha_1) \cos \phi}{\sqrt{\beta(s)\beta_1}} \\
\sqrt{\frac{\beta(s)\beta_1}{\beta(s)}} \sin \phi \\
\sqrt{\frac{\beta_1}{\beta(s)}} (\cos \phi - \alpha(s) \sin \phi)
\end{pmatrix},
\]

(51)
Twiss parameters along a beam line (2)

If we know the transfer matrix from $s_1$ to $s$

$$
M(s) = \begin{pmatrix}
M_{11} & M_{12} \\
M_{21} & M_{22}
\end{pmatrix},
$$

we can calculate the Twiss parameters at $s$ using Eq. (51) as

$$
\alpha(s) = (M_{11}M_{22} + M_{12}M_{21})\alpha_1 - M_{11}M_{21}\beta_1 - M_{12}M_{22} \frac{1 + \alpha_1^2}{\beta_1}
$$

$$
\beta(s) = -2M_{11}M_{12}\alpha_1 + M_{11}^2\beta_1 + M_{12}^2 \frac{1 + \alpha_1^2}{\beta_1}
$$

$$
\phi(s) = \arg(-M_{12}\alpha_1 + M_{11}\beta_1 + iM_{12})
$$

$$
\begin{pmatrix}
\sqrt{\beta(s)/\beta_1} (\cos \phi + \alpha_1 \sin \phi) \\
\sqrt{\beta(s)/\beta_1} \sin \phi
\end{pmatrix}

    \ldots & 1 & \ldots & 1 & \ldots \\
    \ldots & 1 & \ldots & 1 & \ldots \\
    \ldots & 1 & \ldots & 1 & \ldots \\
\end{pmatrix}
$$

$$
\times \begin{pmatrix}
    1 & L & L\theta/2 & \ldots \\
    -\theta & -L\theta/2 & 1 & \ldots \\
    \ldots & \ldots & 1 & \ldots \\
    \ldots & \ldots & \ldots & 1 \\
\end{pmatrix}
\begin{pmatrix}
    1 & \ldots & 1 & \ldots & 1 \\
    \ldots & 1 & \ldots & 1 & \ldots \\
    \ldots & 1 & \ldots & 1 & \ldots \\
    \ldots & 1 & \ldots & 1 & \ldots \\
\end{pmatrix}
$$

$$
= M_x \begin{pmatrix}
    \frac{(c_D + 4)(c_F - 2)\theta}{4} & \frac{(c_D + 4)L\theta}{2} & \frac{(c_D + 4)(c_F - 2)\theta}{4} & \frac{(c_D + 4)L\theta}{2} & \frac{(c_D + 4)(c_F - 2)\theta}{4} \\
    \frac{(c_D + 4)(c_F - 2)\theta}{4} & \frac{(c_D + 4)L\theta}{2} & \frac{(c_D + 4)(c_F - 2)\theta}{4} & \frac{(c_D + 4)L\theta}{2} & \frac{(c_D + 4)(c_F - 2)\theta}{4} \\
\end{pmatrix}
+ O(\theta^2)
$$

(57)
In a FODO cell, now let us consider a horizontal dipole with length \( L \) and the bending angle \( \theta \) in place of the drift space. The on-axis, on-momentum transfer matrix between the center of QFs in \((x, p_x, z, \delta)\) phase space is written as

\[
M = \begin{pmatrix}
1 & \ldots & 1 & \ldots & 1 \\
-k_F/2 & 1 & \ldots & 1 & \ldots & 1 \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots & 1 & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots & 1 \\
\end{pmatrix} \begin{pmatrix}
1 & \ldots & 1 & \ldots & 1 \\
L & \ldots & \theta & \ldots & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\ldots & 1 & \ldots & \ldots & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\end{pmatrix} \begin{pmatrix}
1 & \ldots & 1 \\
k_D & 1 & \ldots & 1 & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\end{pmatrix}
\]

\[
= \begin{pmatrix}
M_x \\
\frac{(c_D + 4)(c_F - 2)}{4} & \frac{(c_D + 4)L\theta}{2} & \frac{(c_D + 4)(c_F - 2)\theta}{4} \\
\frac{(c_D + 4)(c_F - 2)\theta}{4} & 1 & \frac{(c_D + 4)L\theta^2}{4} \\
\end{pmatrix} \left( \frac{(c_D + 4)L\theta}{2} \right), \quad (57)
\]

where \( M_x \) is the 2 by 2 matrix of FODO given by Eq.(44).

\[
M_x = \begin{pmatrix}
1 \pm \frac{c_D - c_F}{L} - \frac{c_D c_F}{L} & \frac{L(2 \pm c_D)}{L} \\
\pm \frac{(c_D - c_F) - c_F c_D}{L} + \frac{c^2_F (1 \pm c_D/2)}{L} & 1 \pm \frac{c_D - c_F}{L} - \frac{c_D c_F}{L/2} \\
\end{pmatrix}. \quad (44)
\]
Dispersión (2)

This transfer matrix has nonzero $M_{x,\delta}$, $M_{px,\delta}$, $M_{z,x}$, $M_{z,px}$ components, which means a coupled motion between $x$- and $z$- planes.

$$
\begin{pmatrix}
M_x & (c_D + 4)c_F - 2)\theta \\
\frac{c_D + 4)(c_F - 2)\theta}{4} & \frac{(c_D + 4)c_F}{2} \\
\frac{2}{4} & -\frac{(c_D + 4)c_F}{1} \\
\end{pmatrix}
$$
Dispersion (2)

This transfer matrix has nonzero $M_{x,\delta}$, $M_{px,\delta}$, $M_{z,x}$, $M_{z,px}$ components, which means a \textit{coupled motion} between $x$- and $z$-planes.

In general, any \textit{stable} coupled symplectic matrix $M$ can be decomposed into a non-coupled semi-diagonal matrix consisting of 2 by 2 matrices $M_{x,y,z}$ by

$$D^{-1}MD = \begin{pmatrix}
M_x & . & . \\
. & M_y & . \\
. & . & M_z
\end{pmatrix}, \quad (58)$$

where $D$ is a symplectic matrix.

This means that any stable coupled motion can be decoupled into 1D motions, by the choice of variables by the matrix $D$ by

\[
\begin{pmatrix}
M_x & . & . \\
. & M_y & . \\
. & . & M_z
\end{pmatrix}
\]
Dispersion (2)

This transfer matrix has nonzero $M_{x,\delta}$, $M_{px,\delta}$, $M_{z,x}, M_{z,px}$ components, which means a coupled motion between $x$- and $z$-planes.

In general, any stable coupled symplectic matrix $M$ can be decomposed into a non-coupled semi-diagonal matrix consisting of 2 by 2 matrices $M_{x,y,z}$ by

$$D^{-1}MD = \begin{pmatrix} M_x & \cdot & \cdot \\ \cdot & M_y & \cdot \\ \cdot & \cdot & M_z \end{pmatrix}, \quad \text{(58)}$$

where $D$ is a symplectic matrix.

This means that any stable coupled motion can be decoupled into 1D motions, by the choice of variables by the matrix $D$ by

$$\begin{pmatrix} x_eta \\ p_{x\beta} \\ y_\beta \\ p_{y\beta} \\ z_\beta \\ \delta_\beta \end{pmatrix} = D^{-1} \begin{pmatrix} x \\ p_x \\ y \\ p_y \\ z \\ \delta \end{pmatrix}, \quad \text{(59)}$$

where the lhs are the uncoupled coordinates, or betatron coordinates, for which we can define the Twiss parameters in a usual way of a 1D motion.
Dispersion (3)

Consider a FODO with dipoles having the cell transfer matrix for $x, z$ planes:

$$M = \begin{pmatrix}
M_{11} & M_{12} & \cdots & M_{16} \\
M_{21} & M_{22} & \cdots & M_{26} \\
-M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & \cdots & 1 \\
\vdots & \vdots & \ddots & \vdots \\
\end{pmatrix}.$$  \hspace{1cm} (60)

The matrix $M$ is semi-diagonalized by another matrix.
Consider a FODO with dipoles having the cell transfer matrix for $x, z$ planes:

$$
M = \begin{pmatrix}
M_{11} & M_{12} & \cdots & M_{16} \\
M_{21} & M_{22} & \cdots & M_{26} \\
-\left(M_{11}M_{26} + M_{21}M_{16}\right) & \left(-M_{12}M_{26} + M_{22}M_{16}\right) & \cdots & M_{16} \\
\cdots & \cdots & \cdots & \cdots \\
\end{pmatrix}.
$$

(60)

The matrix $M$ is semi-diagonalized by another matrix

$$
D = \begin{pmatrix}
1 & \cdots & \eta_x \\
\cdots & \cdots & \cdots \\
-\eta_{px} & \eta_x & 1 \\
\cdots & \cdots & \cdots \\
\end{pmatrix}
$$

as $D^{-1}MD = \begin{pmatrix}M_{11} & M_{12} & \cdots & \cdots \\
M_{21} & M_{22} & \cdots & \cdots \\
\cdots & \cdots & \cdots & \cdots \\
\cdots & \cdots & \cdots & 1 \\
\cdots & \cdots & \cdots & \cdots \\
\end{pmatrix}$

(61)

with

$$
D^{-1} = D/\{\eta_x \rightarrow -\eta_x, \ \eta_{px} \rightarrow -\eta_{px}\}
$$
Dispersion (3)

Consider a FODO with dipoles having the cell transfer matrix for \( x, z \) planes:

\[
M = \begin{pmatrix}
M_{11} & M_{12} & \cdots & M_{16} \\
M_{21} & M_{22} & \cdots & M_{26} \\
-M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & \cdots & 1 \\
\vdots & \vdots & \ddots & \vdots \\
M_{15} & M_{16} & \cdots & M_{56}
\end{pmatrix}
\]  

The matrix \( M \) is semi-diagonalized by another matrix

\[
D = \begin{pmatrix}
1 & \cdots & \eta_x \\
\vdots & \ddots & \vdots \\
\eta_{px} & \eta_x & 1 \\
\eta_{px} & \eta_x & 1 \\
\eta_{px} & \eta_x & 1
\end{pmatrix}
\]  

as \( D^{-1}MD = \begin{pmatrix}
M_{11} & M_{12} & \cdots & \cdots \\
M_{21} & M_{22} & \cdots & \cdots \\
\vdots & \vdots & \ddots & \vdots \\
\vdots & \vdots & \ddots & M_{D56}
\end{pmatrix}
\)

with

\[
D^{-1} = D \cdot \{\eta_x \rightarrow -\eta_x, \ \eta_{px} \rightarrow -\eta_{px}\}
\]
Dispenison (3)

Consider a FODO with dipoles having the cell transfer matrix for $x, z$ planes:

$$
M = \begin{pmatrix}
M_{11} & M_{12} & \cdots & M_{16} \\
M_{21} & M_{22} & \cdots & M_{26} \\
\vdots & \vdots & \ddots & \vdots \\
-M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & \cdots & 1 \\
\end{pmatrix}
$$

The matrix $M$ is semi-diagonalized by another matrix

$$
D = \begin{pmatrix}
1 & \cdots & \eta_x \\
\vdots & \ddots & \vdots \\
-\eta_{px} & \eta_x & 1 \\
\end{pmatrix} \quad \text{as} \quad D^{-1}MD = \begin{pmatrix}
M_{11} & M_{12} & \cdots & \cdots \\
M_{21} & M_{22} & \cdots & \cdots \\
\vdots & \vdots & \ddots & \vdots \\
\cdots & \cdots & \cdots & M_{D56} \\
\end{pmatrix}
$$

with

- **physical to normal**
- **normal to physical**

$$
D^{-1} = D / \{ \eta_x \rightarrow -\eta_x, \ \eta_{px} \rightarrow -\eta_{px} \}$$
Dispersion (3)

Consider a FODO with dipoles having the cell transfer matrix for $x,z$ planes:

$$M = \begin{pmatrix}
M_{11} & M_{12} & \cdots & M_{16} \\
M_{21} & M_{22} & \cdots & M_{26} \\
-\frac{M_{11}M_{26} + M_{21}M_{16}}{4} & -\frac{M_{12}M_{26} + M_{22}M_{16}}{4} & \cdots & \frac{1}{4} \\
\vdots & \vdots & \ddots & \vdots \\
\end{pmatrix} \quad (60)$$

The matrix $M$ is semi-diagonalized by another matrix

$$D = \begin{pmatrix}

\vdots & \ddots & \vdots \\
-\eta_{px} & \eta_x & 1 \\
\end{pmatrix} \quad \text{as} \quad D^{-1}MD = \begin{pmatrix}
M_{11} & M_{12} & \cdots & \cdots \\
M_{21} & M_{22} & \cdots & \cdots \\
\vdots & \vdots & \ddots & \vdots \\
\cdots & \cdots & \cdots & M_{D56} \\
\end{pmatrix} \quad (61)$$

with

$$\eta_x = \frac{(1 - M_{22})M_{16} + M_{12}M_{26}}{4 \sin^2(\mu_x/2)}, \quad \eta_{px} = \frac{M_{21}M_{16} + (1 - M_{11})M_{26}}{4 \sin^2(\mu_x/2)}, \quad D^{-1} = D/\{\eta_x \rightarrow -\eta_x, \eta_{px} \rightarrow -\eta_{px}\} \quad (62)$$

physical to normal

normal to physical
Consider a FODO with dipoles having the cell transfer matrix for $x, z$ planes:

$$
M = \begin{pmatrix}
M_{11} & M_{12} & M_{16} \\
M_{21} & M_{22} & M_{26} \\
-M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & 1
\end{pmatrix}.
$$

(60)

The matrix $M$ is semi-diagonalized by another matrix $D$:

$$
D = \begin{pmatrix}
1 & \cdot & \cdot & \eta_x \\
\cdot & 1 & \cdot & \eta_{px} \\
\cdot & \cdot & 1 & \eta_x \\
-\eta_{px} & \eta_x & 1 & \cdot
\end{pmatrix}
$$

as

$$
D^{-1}MD = \begin{pmatrix}
M_{11} & M_{12} & \cdot & \cdot \\
M_{21} & M_{22} & \cdot & \cdot \\
\cdot & \cdot & 1 & M_{D56} \\
\cdot & \cdot & \cdot & 1
\end{pmatrix}
$$

(61)

with

$$
\eta_x = \frac{(1 - M_{22})M_{16} + M_{12}M_{26}}{4 \sin^2(\mu_x/2)},
$$

$$
\eta_{px} = \frac{M_{21}M_{16} + (1 - M_{11})M_{26}}{4 \sin^2(\mu_x/2)},
$$

where we have used $M_{11} + M_{22} = 2 \cos \mu_x$ from Eq. (45).

$$
M_{x,y} = \begin{pmatrix}
\cos \mu_{xy} + \alpha_{x,y} \sin \mu_{xy} & \beta_{x,y} \sin \mu_{xy} \\
\frac{1 + \alpha_{x,y}^2}{\beta_{x,y}} \sin \mu_{xy} & \cos \mu_{xy} - \alpha_{x,y} \sin \mu_{xy}
\end{pmatrix}.
$$

(45)
In the case of the FODO transfer matrix Eq. (57), the solution Eq. (62) is

\[
\eta_x = \frac{(4 + c_D) L \theta}{2(c_F - c_D) + c_F c_D} + \frac{2L + \beta_x \sin \mu_x}{4 \sin^2(\mu_x/2)^2} \theta , \tag{63}
\]

\[
\eta_{px} = 0 , \tag{64}
\]

then the matrix M is semi-diagonalized as
In the case of the FODO transfer matrix Eq. (57), the solution Eq. (62) is

\[
\eta_x = \frac{(4 + c_D)L\theta}{2(c_F - c_D) + c_FC_D - \frac{2(4 + c_D)\theta}{2}}
\]

(63)

\[
\eta_{px} = 0,
\]

(65)

then the matrix M is semi-diagonalized as

\[
M = \begin{pmatrix}
M_{xx} & \frac{(c_D + 4)L\theta}{2(4 + c_D)\theta} \\
\frac{(c_D + 4)(c_F - 2)\theta}{4 - \frac{(c_D + 4)L\theta}{2}} & 1 - \frac{(4 + c_D)\theta^2}{4}
\end{pmatrix}
\]

(57)
Dispersion (4)

In the case of the FODO transfer matrix Eq. (57), the solution Eq. (62) is

\[
\eta_x = \frac{(4 + c_D)L\theta}{2(c_F - c_D) + c_F c_D} \\
= \frac{2L + \beta_x \sin \mu_x}{4 \sin^2(\mu_x/2)} \theta ,
\]

\[
\eta_{px} = 0 , \quad (65)
\]

then the matrix M is semi-diagonalized as

\[
\eta_x = \frac{(1 - M_{22})M_{16} + M_{12}M_{26}}{4 \sin^2(\mu_x/2)} , \quad (62)
\]

\[
\eta_{px} = \frac{M_{21}M_{16} + (1 - M_{11})M_{26}}{4 \sin^2(\mu_x/2)} ,
\]
In the case of the FODO transfer matrix Eq. (57), the solution Eq. (62) is

\[
\eta_x = \frac{(4 + c_D) L \theta}{2(c_F - c_D) + c_F c_D} \\
= \frac{2L + \beta_x \sin \mu_x}{4 \sin^2(\mu_x/2) \theta},
\]

\[
\eta_{px} = 0,
\]

then the matrix M is semi-diagonalized as

\[
D^{-1}MD = \begin{pmatrix}
M_x & & & \\
& \ldots & & \\
& & \ldots & (c_F - 4) \eta_x \theta \\
& & & \frac{2}{1}
\end{pmatrix}
\]
Dispersions (4)

In the case of the FODO transfer matrix Eq. (57), the solution Eq. (62) is

\[ \eta_x = \frac{(4 + c_D)L\theta}{2(c_F - c_D) + c_F c_D} \]
\[ = \frac{2L + \beta_x \sin \mu_x}{4 \sin^2(\mu_x/2)\theta}, \]  
\[ \eta_{px} = 0, \]  
then the matrix \( M \) is semi-diagonalized as

\[ D^{-1}MD = \begin{pmatrix} M_x & & & \\ & \ddots & & \\ & & \frac{(c_F - 4)\eta_x\theta}{2} & \\ & & & 1 \end{pmatrix} \]  

We will discuss the nature of \( M_{D56} \) in the matrix Eq. (61) later.
Displacement (5)

In this case, the betatron coordinates by Eq. (59) are written as

\[
\begin{pmatrix}
  x_eta \\
  p_{x\beta} \\
  y_eta \\
  p_{y\beta} \\
  z_eta \\
  \delta_eta
\end{pmatrix} = D^{-1}
\begin{pmatrix}
  x \\
  p_x \\
  y \\
  p_y \\
  z \\
  \delta
\end{pmatrix}
\]

(59)

and other variables are unchanged.

\[
x_\beta = x - \eta_x \delta ,
\]

(67)

\[
p_{x\beta} = p_x - \eta_{px} \delta ,
\]

(68)

\[
z_\beta = z + \eta_{px} x - \eta_x p_x ,
\]

(69)
Dispersion (5)

In this case, the betatron coordinates by Eq. (59) are written as

\[
\begin{align*}
  x_\beta &= x - \eta_x \delta, \\
  p_{x\beta} &= p_x - \eta_{p_x} \delta, \\
  z_\beta &= z + \eta_{p_x} x - \eta_x p_x,
\end{align*}
\]

and other variables are unchanged.

In this special case, the resulting 2 by 2 transfer matrix \( M_x \) in Eq. (66) did not change, but in the \( z \)-plane, the 2 by 2 matrix or \( M_{z\delta} \) in Eq. (66) has changed.

\[
D^{-1}MD = \begin{pmatrix}
  M_x & \cdots \\
  \cdots & \frac{(c_F - 4)\eta_x \theta}{2} \\
  \cdots & \cdots \\
  1 & \cdots \\
\end{pmatrix}
\]

(66)
Dispersion (5)

In this case, the betatron coordinates by Eq. (59) are written as

\[
\begin{align*}
    x_\beta &= x - \eta_x \delta, \\
    p_{x\beta} &= p_x - \eta_{px} \delta, \\
    z_\beta &= z + \eta_{px} x - \eta_x p_x,
\end{align*}
\]

and other variables are unchanged.

In this special case, the resulting 2 by 2 transfer matrix \( M_x \) in Eq. (66) did not change, but in the \( z \)-plane, the 2 by 2 matrix or \( M_{z\delta} \) in Eq. (66) has changed.

Note that such a simple decoupling by dispersions as Eqs. (67–69) is only possible when there is no acceleration in the beam line. If there is an RF cavity in a non-dispersive location in a beam line, the \( x \)-\( z \) coupling requires more parameters to decouple. The resulting 2 by 2 matrices will not preserve the forms of Eq. (66), in such a general case.

\[
D^{-1}MD = \begin{pmatrix}
    M_x & \cdots & \cdots \\
    \cdots & 1 & \frac{(c_F - 4)\eta_x \theta}{2} \\
    \cdots & \cdots & \frac{1}{2}
\end{pmatrix}
\]
After obtained the dispersions at a particular location \( s = s_1 \) of a beam line, it is possible to transfer the dispersion at \( s_1 \) to another location \( s \) in the beam line.

Let us denote the transfer matrix from \( s_1 \) to \( s \) by \( M(s) \).

The decoupling matrix \( D(s) \) should be chosen to semi-diagonalize \( M(s) \) to \( M_{D(s)} \) as:

\[
D(s) \begin{pmatrix} M_x(s) \\ M_y(s) \\ M_z(s) \end{pmatrix} = \begin{pmatrix} 0 \\ M_x(s) \\ M_y(s) \\ M_z(s) \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \end{pmatrix},
\]

where \( M_{x}, y, z (s) \) are the 2 by 2 transfer matrices from \( s_1 \) to \( s \).
Dispersion along a beam line

After obtained the dispersions at a particular location \( s = s_1 \) of a beam line, it is possible to transfer the dispersion at \( s_1 \) to another location \( s \) in the beam line.

Let us denote the transfer matrix from \( s_1 \) to \( s \) by \( M(s) \).

\[
D(s)M(s_1)D = M_D(s) = 0\]
Dispersion along a beam line

After obtained the dispersions at a particular location \( s = s_1 \) of a beam line, it is possible to transfer the dispersion at \( s_1 \) to another location \( s \) in the beam line.

Let us denote the transfer matrix from \( s_1 \) to \( s \) by \( M(s) \).

The decoupling matrix \( D(s) \) should be chosen to semi-diagonalize \( M(s) \) to \( M_D(s) \) as:

\[
D(s)^{-1}M(s)D = M_D(s) = \begin{pmatrix}
M_x(s) & . & . \\
. & M_y(s) & . \\
. & . & M_z(s)
\end{pmatrix}, \tag{70}
\]

where \( M_{x,y,z}(s) \) are the 2 by 2 transfer matrices from \( s_1 \) to \( s \).
Dispersion along a beam line

After obtained the dispersions at a particular location \( s = s_1 \) of a beam line, it is possible to transfer the dispersion at \( s_1 \) to another location \( s \) in the beam line.

Let us denote the transfer matrix from \( s_1 \) to \( s \) by \( M(s) \).

The decoupling matrix \( D(s) \) should be chosen to semi-diagonalize \( M(s) \) to \( M_D(s) \) as:

\[
D(s)^{-1} M(s) D = M_D(s) = \begin{pmatrix}
M_x(s) & \cdot & \cdot \\
\cdot & M_y(s) & \cdot \\
\cdot & \cdot & M_z(s)
\end{pmatrix}, \tag{70}
\]

where \( M_{x,y,z}(s) \) are the 2 by 2 transfer matrices from \( s_1 \) to \( s \).
Dispersion along a beam line

After obtained the dispersions at a particular location \( s = s_1 \) of a beam line, it is possible to transfer the dispersion at \( s_1 \) to another location \( s \) in the beam line.

Let us denote the transfer matrix from \( s_1 \) to \( s \) by \( M(s) \).

The decoupling matrix \( D(s) \) should be chosen to semi-diagonalize \( M(s) \) to \( M_D(s) \) as:

\[
D(s)^{-1} M(s) D = M_D(s) = \begin{pmatrix} M_x(s) & . & . \\ . & M_y(s) & . \\ . & . & M_z(s) \end{pmatrix},
\]

(70)

where \( M_{x,y,z}(s) \) are the 2 by 2 transfer matrices from \( s_1 \) to \( s \).
Dispersions along a beam line (2)

In the case of a simple dispersion in $x$-$z$ plane, $M(s)$ is expressed as

$$
M(s) = \begin{pmatrix}
M_{11} & M_{12} & \cdots & M_{16} \\
M_{21} & M_{22} & \cdots & M_{26} \\
-M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & \cdots & M_{56} \\
\vdots & \vdots & \ddots & \vdots \\
\vdots & \vdots & \cdots & 1
\end{pmatrix}.
$$

(71)
Dispersions along a beam line (2)

In the case of a simple dispersion in $x$-$z$ plane, $M(s)$ is expressed as

$$M(s) = \begin{pmatrix}
    M_{11} & M_{12} & \cdots & M_{16} \\
    M_{21} & M_{22} & \cdots & M_{26} \\
    \vdots & \vdots & \ddots & \vdots \\
    -M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & \cdots & 1
\end{pmatrix}. \quad (71)$$

Then the matrix $D(s)$ is written as

$$D(s) = \begin{pmatrix}
    1 & \cdots & \eta_x(s) \\
    \vdots & \ddots & \vdots \\
    -\eta_{px}(s) & \eta_x(s) & 1 \\
    \vdots & \ddots & \ddots
\end{pmatrix}, \quad (72)$$

with dispersions at $s$:

$$\eta_x(s) = M_{11} + M_{12} \eta_{px}(s) + M_{16},$$
$$\eta_{px}(s) = -M_{11}M_{26} + M_{21}M_{16} - M_{12}M_{26} + M_{22}M_{16}.$$
Dispersions along a beam line (2)

In the case of a simple dispersion in \(x\)-\(z\) plane, \(M(s)\) is expressed as

\[
M(s) = \begin{pmatrix}
  M_{11} & M_{12} & M_{16} \\
  M_{21} & M_{22} & M_{26} \\
  -M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & 1
\end{pmatrix}.
\] (71)

Then the matrix \(D(s)\) is written as

\[
D(s) = \begin{pmatrix}
  1 & \cdots & \eta_x(s) \\
  \cdots & 1 & \eta_{px}(s) \\
  -\eta_{px}(s) & \eta_x(s) & 1 \\
  \cdots & \cdots & 1
\end{pmatrix}
\] (72)

with dispersions at \(s\):

\[
\eta_x(s) = M_{11}\eta_x + M_{12}\eta_{px} + M_{16},
\]

\[
\eta_{px}(s) = M_{21}\eta_x + M_{22}\eta_{px} + M_{26}.
\] (73)
Dispersion along a beam line (2)

In the case of a simple dispersion in x-z plane, $M(s)$ is expressed as

$$M(s) = \begin{pmatrix} M_{11} & M_{12} & M_{16} \\ M_{21} & M_{22} & M_{26} \\ -M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & 1 \\ \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots \\ 1 & 1 & 1 \end{pmatrix}. \quad (71)$$

Then the matrix $D(s)$ is written as

$$D(s) = \begin{pmatrix} 1 & \cdots & \eta_x(s) \\ \vdots & \ddots & \vdots \\ -\eta_{px}(s) & \eta_x(s) & 1 \\ \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots \\ \eta_{px}(s) & \eta_{px}(s) & 1 \end{pmatrix}. \quad (72)$$

with dispersions at $s$:

$$\begin{align*}
\eta_x(s) &= M_{11}\eta_x + M_{12}\eta_{px} + M_{16}, \\
\eta_{px}(s) &= M_{21}\eta_x + M_{22}\eta_{px} + M_{26}. \quad (73)
\end{align*}$$

Above means that the the dispersions $(\eta_x(s), \eta_{px}(s))$ behave in the same way as variables $(x, px)$ when the inhomogeneous terms $M_{16}$ and $M_{26}$ are zero.

[Graphs showing $\eta_x/L\theta$ and $\eta_y/L\theta$ for various $\mu_{x,y}$]
Dispersion in a ring

If we put \( s = C + s_1 \) in Eq. (73), then \( M(s) \) becomes the one-turn transfer matrix \( M \) in Eq. (60), and

\[
\begin{align*}
\eta_{s}(s) &= M_{11}\eta_{x} + M_{12}\eta_{px} + M_{16}, \\
\eta_{px}(s) &= M_{21}\eta_{x} + M_{22}\eta_{px} + M_{26}.
\end{align*}
\] (73)
Dispersion in a ring

If we put \( s = C + s_1 \) in Eq. (73), then \( M(s) \) becomes the one-turn transfer matrix \( M \) in Eq. (60), and

\[
\eta_3(s) = M_{11}\eta_x + M_{12}\eta_{px} + M_{16}, \quad (73)
\]
\[
\eta_{px}(s) = M_{21}\eta_x + M_{22}\eta_{px} + M_{26}.
\]

\[
M = \begin{pmatrix}
M_{11} & M_{12} & \cdots & M_{16} \\
M_{21} & M_{22} & \cdots & M_{26} \\
-M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & 1 & M_{56} \\
\cdots & \cdots & \cdots & \cdots \\
\end{pmatrix} \quad (60)
\]
Dispersions in a ring

If we put $s = C + s_1$ in Eq. (73), then $M(s)$ becomes the one-turn transfer matrix $M$ in Eq. (60), and

\[
\begin{align*}
\eta_s(s) &= M_{11}\eta_x + M_{12}\eta_{px} + M_{16}, \\
\eta_{px}(s) &= M_{21}\eta_x + M_{22}\eta_{px} + M_{26}.
\end{align*}
\] (73)

\[
\begin{align*}
\eta_x &= M_{11}\eta_x + M_{12}\eta_{px} + M_{16}, \\
\eta_{px} &= M_{21}\eta_x + M_{22}\eta_{px} + M_{26}.
\end{align*}
\] (74)

by the periodic condition $(\eta_x(s), \eta_{px}(s)) = (\eta_x, \eta_{px})$.

\[
M = \begin{pmatrix}
M_{11} & M_{12} & \cdots & M_{16} \\
M_{21} & M_{22} & \cdots & M_{26} \\
-M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & 1 & M_{56} \\
& & \ddots & \ddots & \ddots \\
& & \ddots & 1 & \ddots
\end{pmatrix}.
\] (60)
Dispersion in a ring

If we put \( s = C + s_1 \) in Eq. (73), then \( M(s) \) becomes the one-turn transfer matrix \( M \) in Eq. (60), and

\[
\eta_s(s) = M_{11}\eta_x + M_{12}\eta_{px} + M_{16}, \quad (73)
\eta_{px}(s) = M_{21}\eta_x + M_{22}\eta_{px} + M_{26}.
\]

by the periodic condition \( (\eta_x(s), \eta_{px}(s)) = (\eta_x, \eta_{px}). \)

\[
M = \begin{pmatrix}
    M_{11} & M_{12} & \cdots & M_{16} \\
    M_{21} & M_{22} & \cdots & M_{26} \\
    -M_{11}M_{26} + M_{21}M_{16} & -M_{12}M_{26} + M_{22}M_{16} & 1 & M_{56} \\
    \cdots & \cdots & \cdots & \cdots
\end{pmatrix}.
\]  \quad (60)

The solution of Eqs. (74) is identical to the solution of semi-diagonalization, Eqs. (62).

\[
\eta_x = \frac{(1 - M_{22})M_{16} + M_{12}M_{26}}{4\sin^2(\mu_x/2)},
\]

\[
\eta_{px} = \frac{M_{21}M_{16} + (1 - M_{11})M_{26}}{4\sin^2(\mu_x/2)},
\]  \quad (62)
Momentum compaction

Then the resulting semi-diagonal matrix $M_D(s)$ becomes

$$M_D(s) = \begin{pmatrix} M_{11} & M_{12} & \cdots & \cdots \\ M_{21} & M_{22} & \cdots & \cdots \\ \cdots & \cdots & 1 & M_{D56} \\ \cdots & \cdots & \cdots & 1 \end{pmatrix},$$

$$D(s)^{-1}M(s)D = M_D(s) \quad (75)$$
Momentum compaction

Then the resulting semi-diagonal matrix $M_D(s)$ becomes

$$M_D(s) = \begin{pmatrix} M_{11} & M_{12} & \cdots & \cdots \\ M_{21} & M_{22} & \cdots & \cdots \\ \vdots & \vdots & \ddots & \vdots \\ \vdots & \vdots & \cdots & 1 \end{pmatrix} \quad \text{with} \quad D(s)^{-1}M(s)D = M_D(s) \quad \text{(75)}$$

$$M_{D56} = (M_{21}\eta_x + M_{22}\eta_{px})M_{16} - (M_{11}\eta_x + M_{12}\eta_{px})M_{26} + M_{56} ,$$

$$= \eta_{px}(s)M_{16} - \eta_x(s)M_{26} + M_{56} , \quad \text{(76)}$$

where we have used Eq. (73).

$$\eta_x(s) = M_{11}\eta_x + M_{12}\eta_{px} + M_{16} ,$$

$$\eta_{px}(s) = M_{21}\eta_x + M_{22}\eta_{px} + M_{26} . \quad \text{(73)}$$
Momentum compaction

Then the resulting semi-diagonal matrix $M_D(s)$ becomes

$$M_D(s) = \begin{pmatrix} M_{11} & M_{12} & \cdots & \cdots \\ M_{21} & M_{22} & \cdots & \cdots \\ \vdots & \vdots & 1 & M_{D56} \\ \vdots & \vdots & \vdots & 1 \end{pmatrix},$$

(75)

$$M_{D56} = (M_{21}\eta_x + M_{22}\eta_{px})M_{16} - (M_{11}\eta_x + M_{12}\eta_{px})M_{26} + M_{56},$$

(76)

where we have used Eq. (73).

Let us consider a small portion of a beam line whose transfer matrix is given by $\Delta M$. According to Eq. (76), the change of $M_{D56}$ is written as

$$\Delta M_{D56} = \eta_{px}(s)\Delta M_{16} - \eta_x(s)\Delta M_{26} + \Delta M_{56}.$$
Momentum compaction

Then the resulting semi-diagonal matrix $M_D(s)$ becomes

$$
M_D(s) = \begin{pmatrix}
M_{11} & M_{12} & \cdots & \cdots \\
M_{21} & M_{22} & \cdots & \cdots \\
\vdots & \vdots & \ddots & \vdots \\
\vdots & \vdots & \vdots & 1 \\
\end{pmatrix}
$$

where we have used Eq. (73).

$$
D(s)^{-1}M(s)D = M_D(s)
$$

$$
M_{D56} = (M_{21}\eta_x + M_{22}\eta_{px})M_{16} - (M_{11}\eta_x + M_{12}\eta_{px})M_{26} + M_{56},
$$

$$
= \eta_{px}(s)M_{16} - \eta_x(s)M_{26} + M_{56},
$$

where we have used Eq. (73).

Let us consider a small portion of a beam line whose transfer matrix is given by $\Delta M$. According to Eq. (76), the change of $M_{D56}$ is written as

$$
\Delta M_{D56} = \eta_{px}(s)\Delta M_{16} - \eta_x(s)\Delta M_{26} + \Delta M_{56}.
$$

Thus the component $M_{D56}$ changes only when there are non-zero $\Delta M_{16}$, $\Delta M_{26}$, $\Delta M_{56}$. Thus $M_{D56}$ does not change in drift spaces nor multipole magnets at least for an on-momentum & on-axis orbit, where $M_{s6} = 0$. 
Momentum compaction (2)

In the case of a dipole with a small length $L = ds$ and a bending angle $\theta = ds/\rho$, the transfer matrix Eq. (29) becomes

$$M = \begin{pmatrix}
1 & \frac{L}{1+\delta} & \frac{L\theta}{2(1+\delta)^2} \\
\vdots & \ddots & \ddots \\
\frac{-\theta}{L\theta(1+2\delta)} & \ddots & 1 - \frac{\rho}{v}\frac{L\theta}{v_d L} \\
\frac{-L\theta(1+2\delta)}{2(1+\delta)^2} & \ddots & \ddots \\
\vdots & \ddots & \ddots \\
\end{pmatrix} + O(\theta)^2. \quad (29)$$

$$\Delta M = \begin{pmatrix}
1 & ds & \ddots \\
\vdots & 1 & ds/\rho \\
\frac{-ds}{\rho} & \ddots & 1 \\
\vdots & \ddots & \ddots \\
\end{pmatrix} + O(ds)^2. \quad (78)$$
Momentum compaction (2)

In the case of a dipole with a small length $L = ds$ and a bending angle $\theta = ds/\rho$, the transfer matrix Eq. (29) becomes

$$M = \begin{pmatrix}
1 & \frac{L}{1+\delta} & \cdots & \frac{L\theta}{2(1+\delta)^2} \\
\vdots & \frac{1}{1+\delta} & \ddots & \vdots \\
\frac{-L(1+2\delta)}{2(1+\delta)^2} & \frac{L}{1+\delta} & \cdots & 1 \\
-\theta & \frac{L(1+2\delta)}{2(1+\delta)^2} & \frac{L}{1+\delta} & \vdots & \ddots & \vdots \\
\frac{-\theta L\rho}{2(1+\delta)^2} & \frac{\rho}{\nu_d} & \frac{\rho}{\nu_d} & \frac{\rho}{\nu_d} & \cdots & 1
\end{pmatrix} + O(\theta^2). \quad (29)$$

Then if we plug in above into Eq. (77), the change of $\Delta M_{D56}$ is written as

$$\Delta M_{D56} = \eta_p x(s) \Delta M_{16} - \eta_x(s) \Delta M_{26} + \Delta M_{56}. \quad (77)$$

$$\Delta M = \begin{pmatrix}
1 & ds & \cdots \\
\vdots & 1 & \frac{ds}{\rho} \\
\frac{-ds}{\rho} & 1 & \cdots \\
\frac{\rho}{\nu_d} & \frac{\rho}{\nu_d} & \frac{\rho}{\nu_d} & \cdots & 1
\end{pmatrix} + O(ds)^2. \quad (78)$$

$$dM_{D56} = -\eta_{xs} \frac{ds}{\rho}. \quad (79)$$
Momentum compaction (2)

In the case of a dipole with a small length $L = ds$ and a bending angle $\theta = ds/\rho$, the transfer matrix Eq. (29) becomes

$$
M = \begin{pmatrix}
1 & \frac{L}{1 + \delta} & \cdots & \frac{L\theta}{2(1 + \delta)^2} \\
\vdots & 1 & \ddots & \vdots \\
-\theta & -\frac{L\theta(1 + 2\delta)}{2(1 + \delta)^2} & \ddots & 1 \\
\vdots & \ddots & \ddots & 1
\end{pmatrix} + O(\theta^2). \quad (29)
$$

$$
\Delta M = \begin{pmatrix}
1 & ds & \cdots \\
\vdots & 1 & \ddots & \frac{ds}{\rho} \\
-\frac{ds}{\rho} & \ddots & 1 \\
\vdots & \ddots & \ddots & 1
\end{pmatrix} + O(ds^2). \quad (78)
$$

Then if we plug in above into Eq. (77), the change of $\Delta M_{D56}$ is written as

$$
\Delta M_{D56} = \eta_{px}(s)\Delta M_{16} - \eta_x(s)\Delta M_{26} + \Delta M_{S56}. \quad (77)
$$

$$
dM_{D56} = -\eta_{xs}\frac{ds}{\rho}. \quad (79)
$$

By integrating above, we obtain an expression for $M_{D56}$:

$$
M_{D56} = -\int \frac{\eta_x(s)}{\rho(s)} ds. \quad (80)
$$
Momentum compaction (2)

In the case of a dipole with a small length \( L = ds \) and a bending angle \( \theta = ds/\rho \), the transfer matrix Eq. (29) becomes

\[
\Delta M = \begin{pmatrix}
1 & ds & 0 & \frac{ds}{\rho} \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{pmatrix} + O(ds)^2.
\] (78)

Then if we plug in above into Eq. (77), the change of \( \Delta M_{D56} \) is written as

\[
\Delta M_{D56} = \eta_{px}(s) \Delta M_{16} - \eta_x(s) \Delta M_{26} + \Delta M_{56}.
\] (77)

By integrating above, we obtain an expression for \( M_{D56} \):

\[
M_{D56} = -\int \frac{\eta_x(s)}{\rho(s)} ds.
\] (80)

For a storage ring, the quantity \( M_{56} \) is sometimes expressed in terms of the ratio to the circumference \( C \) as

\[
\alpha_p \equiv -\frac{M_{D56}}{C} = \frac{1}{C} \int \frac{\eta_x(s)}{\rho(s)} ds,
\] (81)

where the ratio \( \alpha_p \) is called momentum compaction factor.
Let us consider a ring with an RF cavity with the voltage $V_c$ and the phase $\phi_{RF}$ at a dispersion-free location. Using Eq. (40), the one-turn, on-axis transfer matrix $M_z$ in $z$-plane from the center of the cavity is written as:

$$M_z = \begin{pmatrix} 1 & 0 \\ -\frac{\alpha_p C k_z}{2} & 1 \end{pmatrix} = \begin{pmatrix} 1 - \frac{\alpha_p C k_z}{2} & -\alpha_p C \\ \frac{\alpha_p C k_z^2}{4} & 1 - \frac{\alpha_p C k_z}{2} \end{pmatrix}, \quad (82)$$

where $k_z = \frac{\phi_{RF}}{eV_c}$. By equating $M_z$ with the representation by Twiss parameters

$$M_z = \begin{pmatrix} \cos \mu_z & \sin \mu_z \\ \sin \mu_z & -\cos \mu_z \end{pmatrix}, \quad (83)$$

we obtain at the middle of the RF cavity:

$$\mu_z = 0, \quad \cos \mu_z = 1, \quad \mu_z = \arcsin \frac{\beta}{\gamma}.$$ \quad (84)$$

Note that $k_z > 0$ for stability, and $\mu_z < 0$ for $\beta > 0$. In the case of $|\mu_z| \approx 1$, $\beta$ and $\gamma$ are nearly constant over the ring, and:

$$\mu_z \approx \arcsin \frac{\beta}{\gamma}, \quad (85)$$

Synchrotron motion
Synchrotron motion

Let us consider a ring with an RF cavity with the voltage $V_c$ and the phase $\phi_{RF}$ at a dispersion-free location. Using Eq. (40), the one-turn, on-axis transfer matrix $M_z$ in $z$-plane from the center of the cavity is written as:

$$M_z = \begin{pmatrix} 1 & \frac{1}{k_z/2} \\
-\alpha_p C & 1 \end{pmatrix} = \begin{pmatrix} 1 - \frac{\alpha_p C k_z}{2} & -\alpha_p C \\
k_z - \frac{\alpha_p C k_z^2}{4} & 1 - \frac{\alpha_p C k_z}{2} \end{pmatrix}, \quad (82)$$

with

$$k_z = \frac{\omega_{RF} e V_c}{c P_d} \cos \phi_{RF}. \quad (83)$$

By equating $M_z$ with the representation by Twiss parameters
Synchrotron motion

Let us consider a ring with an RF cavity with the voltage \( V_c \) and the phase \( \phi_{RF} \) at a dispersion-free location. Using Eq. (40), the one-turn, on-axis transfer matrix \( M_z \) in \( z \)-plane from the center of the cavity is written as:

\[
M_z = \begin{pmatrix} 1 & 1 \alpha_p C \frac{1}{2} & \frac{-\alpha_p C}{2} \\ k_z/2 & 1 & 1 \end{pmatrix} = \begin{pmatrix} 1 - \frac{\alpha_p C k_z}{2} & -\alpha_p C \\ k_z - C k_z^2 / 4 & 1 - \frac{\alpha_p C k_z}{2} \end{pmatrix},
\] (82)

with \( k_z = \frac{\omega_{RF} e V_c}{v^2 c P_d} \cos \phi_{RF} \). (83)

By equating \( M_z \) with the representation by Twiss parameters

\[
M_z = \begin{pmatrix} \cos \mu_z + \alpha_z \sin \mu_z & \beta_z \sin \mu_z \\ 1 + \alpha_z^2 \sin \mu_z & \beta_z \sin \mu_z \end{pmatrix},
\] (84)

we obtain at the middle of the RF cavity:
Synchrotron motion

Let us consider a ring with an RF cavity with the voltage $V_c$ and the phase $\phi_{RF}$ at a dispersion-free location. Using Eq. (40), the one-turn, on-axis transfer matrix $M_z$ in $z$-plane from the center of the cavity is written as:

$$M_z = \begin{pmatrix} 1 & -\alpha_p C \varepsilon_z/2 \\ \alpha_p C k_z/2 & 1 \end{pmatrix} = \begin{pmatrix} 1 - \frac{\alpha_p C k_z}{2} & -\alpha_p C \\ k_z - \frac{\alpha_p C k_z^2}{4} & 1 - \frac{\alpha_p C k_z}{2} \end{pmatrix},$$

with $k_z = \frac{\omega_{RF}}{v^2} \frac{e V_c}{c P_d} \cos \phi_{RF}.$

By equating $M_z$ with the representation by Twiss parameters

$$M_z = \begin{pmatrix} \cos \mu_z + \alpha_z \sin \mu_z & \beta_z \sin \mu_z \\ \frac{1 + \alpha_z^2}{\beta_z} \sin \mu_z & \cos \mu_z - \alpha_z \sin \mu_z \end{pmatrix},$$

we obtain at the middle of the RF cavity:

$$\alpha_z = 0,$$

$$\cos \mu_z = 1 - \frac{\alpha_p C k_z}{2},$$

$$\beta_z = -\frac{\alpha_p C}{\sin \mu_z}.$$
Synchrotron motion

Let us consider a ring with an RF cavity with the voltage $V_c$ and the phase $\phi_{RF}$ at a dispersion-free location. Using Eq. (40), the one-turn, on-axis transfer matrix $M_z$ in $z$-plane from the center of the cavity is written as:

$$
M_z = \begin{pmatrix}
1 & -\alpha_p C \\
k_z/2 & 1
\end{pmatrix}
\begin{pmatrix}
1 & 0 \\
0 & 1
\end{pmatrix}
\begin{pmatrix}
1 & -\alpha_p C \\
k_z/2 & 1
\end{pmatrix} = \begin{pmatrix}
1 - \frac{\alpha_p C k_z}{2} & -\alpha_p C \\
k_z - \frac{\alpha_p C k_z}{2} & 1 - \frac{\alpha_p C k_z}{2}
\end{pmatrix},
$$

with $k_z = \frac{\omega_{RF} e V_c}{\sqrt{2} e P_d} \cos \phi_{RF}$. \hspace{1cm} (82)

By equating $M_z$ with the representation by Twiss parameters

$$
M_z = \begin{pmatrix}
\cos \mu_z + \alpha_z \sin \mu_z & \beta_z \sin \mu_z \\
\frac{1 + \alpha_z^2}{\beta_z} \sin \mu_z & \cos \mu_z - \alpha_z \sin \mu_z
\end{pmatrix},
$$

we obtain at the middle of the RF cavity:

$$
\alpha_z = 0,
\cos \mu_z = 1 - \frac{\alpha_p C k_z}{2},
\beta_z = -\frac{\alpha_p C}{\sin \mu_z}.
$$

Note that $\alpha_p k_z > 0$ for the stability, and $\mu_z < 0$ for $\alpha_p > 0$. \hspace{1cm} (85)
Synchrotron motion

Let us consider a ring with an RF cavity with the voltage \( V_c \) and the phase \( \phi_{RF} \) at a dispersion-free location. Using Eq. (40), the one-turn, on-axis transfer matrix \( M_z \) in \( z \)-plane from the center of the cavity is written as:

\[
M_z = \begin{pmatrix} 1 & -\alpha_p C \\ \frac{1}{k_z/2} & 1 \end{pmatrix} \begin{pmatrix} 1 & 1 \\ \frac{k_z/2}{1} & 1 \end{pmatrix} = \begin{pmatrix} 1 - \frac{\alpha_p C k_z}{2} & -\alpha_p C \\ \frac{k_z}{2} - \frac{\alpha_p C k_z^2}{4} & 1 - \frac{\alpha_p C k_z}{2} \end{pmatrix},
\]  

(82)

with

\[
k_z = \frac{\omega_{RF} V_c}{e V_{RF}} \cos \phi_{RF}.
\]  

(83)

By equating \( M_z \) with the representation by Twiss parameters

\[
M_z = \begin{pmatrix} \cos \mu_z + \alpha_z \sin \mu_z & \beta_z \sin \mu_z \\ \frac{1 + \alpha_z^2}{\beta_z} \sin \mu_z & \cos \mu_z - \alpha_z \sin \mu_z \end{pmatrix},
\]  

(84)

we obtain at the middle of the RF cavity:

\[
\alpha_z = 0,
\]
\[
\cos \mu_z = 1 - \frac{\alpha_p C k_z}{2},
\]  

(85)

\[
\beta_z = -\frac{\alpha_p C}{\sin \mu_z}.
\]

Note that \( \alpha_p k_z > 0 \) for the stability, and \( \mu_z < 0 \) for \( \alpha_p > 0 \).

In the case of \( |\mu_z| \ll 1 \), \( \alpha_z \) and \( \beta_z \) are nearly constant over the ring, and:

\[
\mu_z^2 \approx \alpha_p C k_z, \quad \beta_z \approx -\frac{\alpha_p C}{\mu_z}.
\]  

(86)
Overview of synchrotron radiation

due to the relativistic kinematics, an ultra-relativistic particle can only radiate within an angle $\theta = \sin^{-1}\left(\frac{1}{\gamma}\right)$.

Then the pulse length of the radiation observed at a location far from the ring can be estimated by the time

$$
\Delta t = \frac{c}{\gamma \rho} = \frac{\gamma}{c v}.
$$

Using the uncertainty principle:

$$
\Delta x \Delta p = \frac{\hbar}{2},
$$

classical electron radius, respectively.
Overview of synchrotron radiation

Due to the relativistic kinematics, an ultra-relativistic particle can only radiate within an angle $1/\gamma$. 

\[
e = v \\
p = 1/\gamma \\Delta t \\
c \\
c \\
\approx \frac{3}{\gamma^2}mc^2.
\]
Due to the relativistic kinematics, an ultra-relativistic particle can only radiate within an angle $1/\gamma$.

Then the pulse length of the radiation observed at a location far from the ring can be estimated by the time difference between the particle and the light:

$$\Delta t \approx \frac{\rho/\gamma}{v} - \frac{\rho \sin 1/\gamma}{c} \quad (87)$$

$$\approx \frac{2\rho}{3\gamma^3 c} \quad (88)$$
Due to the relativistic kinematics, an ultra-relativistic particle can only radiate within an angle $1/\gamma$.

Then the pulse length of the radiation observed at a location far from the ring can be estimated by the time difference between the particle and the light:

$$\Delta t \approx \frac{\rho / \gamma}{v} - \frac{\rho \sin 1/\gamma}{c} \quad \text{(87)}$$

$$\approx \frac{2\rho}{3\gamma^3 c} \quad \text{(88)}$$

The energy of the photon should be characterized by critical energy using the uncertainty principle:

$$u_e = \frac{\hbar}{\Delta t} = \frac{3}{2} \gamma^3 \frac{\hbar c}{\rho} = \frac{3}{2} \gamma^3 mc^2 \left( \frac{r_e}{\alpha \rho} \right) \quad \text{(89)}$$

where $\alpha$ and $r_e$ are the fine structure constant and the classical electron radius, respectively.
Overview of synchrotron radiation (2)

Most basic characteristics of the radiation, concerning to the beam, are represented by the following formulas: The expected number of photons in a bending angle $\phi$:

$$\langle N \rangle = \frac{5}{2 \sqrt{3}} \alpha \gamma \phi . \quad (90)$$
Overview of synchrotron radiation (2)

Most basic characteristics of the radiation, concerning to the beam, are represented by the following formulas: The expected number of photons in a bending angle $\phi$:

$$\langle N \rangle = \frac{5}{2 \sqrt{3}} \alpha \gamma \phi.$$  \hspace{1cm} (90)

The expected value of photon energy and the square of photon energy:

$$\langle u \rangle = \frac{8}{15 \sqrt{3}} u_c,$$ \hspace{1cm} (91)

$$\langle u^2 \rangle = \frac{11}{27} u_c^2.$$ \hspace{1cm} (92)
Overview of synchrotron radiation (2)

$$\sum_{k=0}^{\infty} \lambda_k = 1, \quad \sum_{k=0}^{\infty} k \lambda_k = \langle N \rangle. \hfill (100)$$

The beam energy changes as

$$E_k = E_0 - \sum_i^{k} u_i,$$  \hfill (101)$$

$$\langle E_k^2 \rangle = E_0^2 - 2E_0 \left( \sum_{i=1}^{k} u_i \right) + \left( \sum_{i=1}^{k} \sum_{j=1}^{k} u_i u_j \right)$$

$$= E_0^2 - 2kE_0 \langle u \rangle + k(k-1)\langle u \rangle^2 + k\langle u^2 \rangle. \hfill (102)$$

Then

$$\langle E^2 \rangle = \sum_{k=0}^{\infty} \lambda_k \langle E_k^2 \rangle.$$
Justification of $\langle E^2 \rangle - \langle E \rangle^2 = \langle N \rangle \langle u^2 \rangle$

If the system emits $k$ uncorrelated photons randomly, its probability is given by

$$\lambda_k = \frac{\langle N \rangle^k}{k!} \exp(-\langle N \rangle).$$

(99)

Note that

$$\sum_{k=0}^\infty \lambda_k = 1, \quad \sum_{k=0}^\infty k \lambda_k = \langle N \rangle.$$

(100)

The beam energy changes as

$$E_k = E_0 - \sum_{i=1}^k u_i, \quad \langle E^2 \rangle_k = E_0^2 - 2E_0 \left( \sum_{i=1}^k u_i \right) + \left( \sum_{j=1}^k \sum_{j=1}^k u_i u_j \right),$$

$$= E_0^2 - 2kE_0 \langle u \rangle + k(k - 1)\langle u \rangle^2 + k\langle u^2 \rangle.$$

(102)

Then

$$\langle E^2 \rangle = \sum_{k=0}^\infty \lambda_k \langle E^2 \rangle_k$$

$$= E_0^2 - 2E_0 \langle N \rangle \langle u \rangle + \sum_{k=0}^\infty k(k - 1)\frac{\langle N \rangle^k}{k!} \exp(-\langle N \rangle)\langle u^2 \rangle + \langle N \rangle\langle u^2 \rangle.$$

$$= E_0^2 - 2E_0 \langle N \rangle \langle u \rangle + \langle N \rangle^2 \langle u \rangle^2 + \langle N \rangle \langle u^2 \rangle$$

$$= \langle E \rangle^2 + \langle N \rangle \langle u^2 \rangle.$$

(103)
Effects of radiation on the beam motion

Hereafter we assume the particle is ultra-relativistic, i.e., $\gamma \gg 1$. The effects of radiation or emission of photons on the particle motion are characterized as:

- The position of a particle does not change due to radiation.
- The radiation is almost in the same direction of the particle momenta, within an angular deviation $\frac{1}{\gamma}$.
- Thus the particle almost does not change the direction of motion. The changes of the momenta are expressed as $P' = P + \frac{P \times u}{c}$, $P'_x, y = P_x, y + \frac{P_x, y u}{c}$.
- The emission is a totally random process. It is not possible to tell when and where a particle emits a photon. Each amount of photon is also stochastic under a given probability distribution.
Effects of radiation on the beam motion

Hereafter we assume the particle is ultra-relativistic, i.e., $\gamma \gg 1$. The effects of radiation or emission of photons on the particle motion are characterized as:

- The position of a particle does not change due to radiation.
Effects of radiation on the beam motion

Hereafter we assume the particle is ultra-relativistic, i.e., $\gamma \gg 1$. The effects of radiation or emission of photons on the particle motion are characterized as:

- The position of a particle does not change due to radiation.
- The radiation is almost in the same direction of the particle momenta, within an angular deviation $\lesssim 1/\gamma$. The angular divergence will be omitted below for the time being.
Effects of radiation on the beam motion

Hereafter we assume the particle is ultra-relativistic, i.e., \( \gamma \gg 1 \). The effects of radiation or emission of photons on the particle motion are characterized as:

- The position of a particle does not change due to radiation.
- The radiation is almost in the same direction of the particle momenta, within an angular deviation \( \lesssim 1/\gamma \). The angular divergence will be omitted below for the time being.
- Thus the particle almost does not change the direction of motion. The changes of the momenta are expressed as

\[
P \rightarrow P - u/c , \quad P_{x,y} \rightarrow P_{x,y} - \frac{u P_{x,y}}{c P} .
\]

(104)
Effects of radiation on the beam motion

Hereafter we assume the particle is ultra-relativistic, i.e., $\gamma \gg 1$. The effects of radiation or emission of photons on the particle motion are characterized as:

- The position of a particle does not change due to radiation.
- The radiation is almost in the same direction of the particle momenta, within an angular deviation $\leq 1/\gamma$, The angular divergence will be omitted below for the time being.
- Thus the particle almost does not change the direction of motion. The changes of the momenta are expressed as

$$P \rightarrow P - u/c, \quad P_{x,y} \rightarrow P_{x,y} - \frac{u P_{x,y}}{c P}.$$  \hspace{1cm} (104)

- The emission of photons is a totally random process. It is not possible to tell when and where a particle emits a photon. Each amount of photon is also stochastic under a given probability distribution.
Local radiation damping

Now let us consider a particle having small deviations \((x, p_x, y, p_y, z, \delta)\) from the \textit{standard orbit}, where the radiation is given by \(dW_d\).
Local radiation damping

Now let us consider a particle having small deviations \((x, p_x, y, p_y, z, \delta)\) from the standard orbit, where the radiation is given by \(dW_d\).

Then the change of momenta relative to the standard orbit due to radiation are written as

\[
d\delta = -(dW - dW_d)
= -\frac{\partial dW}{\partial \delta} \delta - \frac{\partial dW}{\partial x} x - \frac{\partial dW}{\partial y} y, \tag{105}
\]
Local radiation damping

Now let us consider a particle having small deviations \((x, p_x, y, p_y, z, \delta)\) from the *standard orbit*, where the radiation is given by \(dW_d\).

Then the change of momenta relative to the standard orbit due to radiation are written as

\[
d\delta = -(dW - dW_d) = -\frac{\partial dW}{\partial \delta} \delta - \frac{\partial dW}{\partial x} x - \frac{\partial dW}{\partial y} y, \tag{105}
\]

\[
dp_{x,y} = -(dWp_{x,y} - dWdp_{x,y,d}) = -dWp_{x,y}, \tag{106}
\]

where we have assumed the momentum components at the standard orbit \(p_{x,y,d}\) are zero.
Local radiation damping

Now let us consider a particle having small deviations \((x, p_x, y, p_y, z, \delta)\) from the *standard orbit*, where the radiation is given by \(dW_d\).

Then the change of momenta relative to the standard orbit due to radiation are written as

\[
d\delta = -(dW - dW_d)
\]

\[
= -\frac{\partial dW}{\partial \delta} \delta - \frac{\partial dW}{\partial x} x - \frac{\partial dW}{\partial y} y ,
\]

\[
dp_{x,y} = -(dW p_{x,y} - dW_d p_{x,y;d})
\]

\[
= -dW p_{x,y} ,
\]

where we have assumed the momentum components at the standard orbit \(p_{x,y;d}\) are zero.

In a simple case with \(\frac{\partial dW}{\partial x} = \frac{\partial dW}{\partial y} = 0\), the equations above become

\[
d\delta = -\frac{\partial dW}{\partial \delta} \delta , \quad dp_{x,y} = -dW p_{x,y} ,
\]

which means a *local damping* of the momenta around the standard orbit.
Local radiation damping (2)

In the case of a uniform (transverse) magnetic field $B$, the momentum loss in a length $ds$ is expressed as

$$dW = -\frac{\langle N \rangle \langle u \rangle}{cP_d}$$  (109)
Local radiation damping (2)

In the case of a uniform (transverse) magnetic field $B$, the momentum loss in a length $ds$ is expressed as

$$dW = -\frac{\langle N \rangle \langle u \rangle}{cP_d}$$

$$\propto P^2 B^2 ds' \propto (1 + \delta)^2$$

using Eq.(93) with $\phi = ds'/\rho$ and $P = (1 + \delta)P_d = eB\rho$. Here we have introduced the orbit length $ds'$, which will be described later.
Local radiation damping (2)

In the case of a uniform (transverse) magnetic field $B$, the momentum loss in a length $ds$ is expressed as

$$dW = -\frac{\langle N \rangle \langle u \rangle}{cP_d}$$

(109)

$$\propto P^2 B^2 ds' \propto (1 + \delta)^2$$

(110)

using Eq.(93) with $\phi = ds'/\rho$ and $P = (1 + \delta)P_d = eB\rho$. Here we have introduced the orbit length $ds'$, which will be described later.

Then the momentum damping coefficient in Eq. (108) is written as

$$\frac{\partial dW}{\partial \delta} = 2dW,$$

(111)

which means the longitudinal damping rate is twice faster than the transverse ones in this simple case.

$$d\delta = -\frac{\partial dW}{\partial \delta} \delta, \quad dp_{x,y} = -dW p_{x,y},$$

(103)
Effects of dispersion on damping

If there are dispersions, the motion should be considered in the betatron coordinates instead of physical coordinates:

\[
\begin{pmatrix}
\chi_eta \\
p_{x\beta} \\
y_eta \\
p_{y\beta}
\end{pmatrix}
= \begin{pmatrix}
x \\
p_x \\
y \\
p_y
\end{pmatrix} - \begin{pmatrix}
\eta_x \\
p_{\eta x} \\
\eta_y \\
p_{\eta y}
\end{pmatrix} \delta
\]

(112)
Effects of dispersion on damping

If there are dispersions, the motion should be considered in the betatron coordinates instead of physical coordinates:

\[
\begin{pmatrix}
  x_{\beta} \\
p_{x\beta} \\
y_{\beta} \\
p_{y\beta}
\end{pmatrix}
= \begin{pmatrix}
x \\
p_x \\
y \\
p_y
\end{pmatrix}
- \begin{pmatrix}
\eta_x \\
\eta_{p_x} \\
\eta_y \\
\eta_{p_y}
\end{pmatrix} \delta
\]

(112)

as well as

\[
z_{\beta} = z + \eta_{p_x} x - \eta_x p_x + \eta_{p_y} y - \eta_y p_y .
\]

(113)
Effects of dispersion on damping

If there are dispersions, the motion should be considered in the betatron coordinates instead of physical coordinates:

\[
\begin{pmatrix}
  x_eta \\
  p_{x\beta} \\
  y_eta \\
  p_{y\beta}
\end{pmatrix} =
\begin{pmatrix}
  x \\
  p_x \\
  y \\
  p_y
\end{pmatrix} -
\begin{pmatrix}
  \eta_x \\
  \eta_{p_x} \\
  \eta_y \\
  \eta_{p_y}
\end{pmatrix} \delta
\]

as well as

\[
z_\beta = z + \eta_{p_x} x - \eta_x p_x + \eta_{p_y} y - \eta_y p_y .
\]

Since we know the physical position \((x, y, z)\) does not change due to radiation:

\[
dx = dy = dz = 0 ,
\]
Effects of dispersion on damping

If there are dispersions, the motion should be considered in the betatron coordinates instead of physical coordinates:

\[
\begin{pmatrix}
  x_eta \\
  p_{x\beta} \\
  y_eta \\
  p_{y\beta}
\end{pmatrix} = \begin{pmatrix}
  x \\
  p_x \\
  y \\
  p_y
\end{pmatrix} - \begin{pmatrix}
  \eta_x \\
  \eta_{px} \\
  \eta_y \\
  \eta_{py}
\end{pmatrix} \delta
\]  

(112)

as well as

\[
z_\beta = z + \eta_{px} x - \eta_x p_x + \eta_{py} y - \eta_y p_y .
\]  

(113)

Since we know the physical position \((x, y, z)\) does not change due to radiation:

\[
dx = dy = dz = 0 ,
\]  

(114)

we obtain

\[
d\delta = -\frac{\partial dW}{\partial x}(x_\beta + \eta_x \delta) - \frac{\partial dW}{\partial y}(y_\beta + \eta_y \delta) - \frac{\partial dW}{\partial \delta} \delta ,
\]

\[
dx_\beta = -\eta_x d\delta ,
\]

\[
dp_{x\beta} = -dW(p_{x\beta} + \eta_{px} \delta) - \eta_{px} dp_x d\delta ,
\]

\[
dy_\beta = -\eta_y d\delta ,
\]

\[
dp_{y\beta} = -dW(p_{y\beta} + \eta_{py} \delta) - \eta_{py} dp_y d\delta ,
\]

\[
dz_\beta = \eta_{px} dx_\beta - \eta_x dp_{x\beta} + \eta_{py} dy_\beta - \eta_y dp_{y\beta} .
\]  

(115)
Effects of dispersion on damping (2)

The effect of radiation in the previous equation can be expressed by a matrix:

\[
\begin{pmatrix}
\frac{dx_\beta}{dt} \\
\frac{dp_{x\beta}}{dt} \\
\frac{dy_\beta}{dt} \\
\frac{dp_{y\beta}}{dt} \\
\frac{dz_\beta}{dt} \\
\frac{d\delta}{dt}
\end{pmatrix} = dR_D 
\begin{pmatrix}
x_\beta \\
p_{x\beta} \\
y_\beta \\
p_{y\beta} \\
z_\beta \\
\delta
\end{pmatrix} = 
\begin{pmatrix}
\frac{\partial W}{\partial x} \eta_x \\
\frac{\partial W}{\partial y} \eta_p \\
\frac{\partial W}{\partial x} \eta_y \\
\frac{\partial W}{\partial y} \eta_p \\
\frac{\partial W}{\partial x} \eta_x \\
\frac{\partial W}{\partial y} \eta_y
\end{pmatrix} 
\begin{pmatrix}
x_\beta \\
p_{x\beta} \\
y_\beta \\
p_{y\beta} \\
z_\beta \\
\delta
\end{pmatrix},
\]

\begin{equation}
(116)
\end{equation}

Note that the longitudinal damping rate is twice faster than the transverse ones.
Effects of dispersion on damping (2)

The effect of radiation in the previous equation can be expressed by a matrix:

$$
\begin{pmatrix}
\frac{dx_B}{d\delta} \\
\frac{dp_{x_B}}{d\delta} \\
\frac{dy_B}{d\delta} \\
\frac{dp_{y_B}}{d\delta} \\
\frac{dz_B}{d\delta}
\end{pmatrix} = dR_D 
\begin{pmatrix}
x_B \\
p_{x_B} \\
y_B \\
p_{y_B} \\
z_B
\end{pmatrix} = 
\begin{pmatrix}
\frac{\partial dW}{\partial x} \eta_x & \frac{\partial dW}{\partial y} \eta_x & -dR_{D66} \eta_x \\
\frac{\partial dW}{\partial x} \eta_{p_x} & \frac{\partial dW}{\partial y} \eta_{p_x} & -(dR_{D66} + dW) \eta_{p_x} \\
\frac{\partial dW}{\partial x} \eta_y & \frac{\partial dW}{\partial y} \eta_y & -dR_{D66} \eta_y \\
\frac{\partial dW}{\partial x} \eta_{p_y} & \frac{\partial dW}{\partial y} \eta_{p_y} & -(dR_{D66} + dW) \eta_{p_y} \\
-dW \eta_x & dW \eta_y & dW(\eta_x \eta_{p_x} + \eta_y \eta_{p_y})
\end{pmatrix} 
\begin{pmatrix}
x_B \\
p_{x_B} \\
y_B \\
p_{y_B} \\
z_B
\end{pmatrix},
$$

(116)

$$
dR_{D66} = -\frac{\partial dW}{\partial x} \eta_x - \frac{\partial dW}{\partial y} \eta_y - \frac{\partial dW}{\partial \delta}.
$$

(117)
Effects of dispersion on damping (2)

The effect of radiation in the previous equation can be expressed by a matrix:

\[
\begin{pmatrix}
  dx_x \\
  dp_x \\
  dy \\
  dp_y \\
  dz \\
  d\delta
\end{pmatrix} = dR_D
\begin{pmatrix}
  x_x \\
  p_x \\
  y \\
  p_y \\
  z \\
  \delta
\end{pmatrix}
= \begin{pmatrix}
  \frac{\partial dW}{\partial x} \eta_x & \frac{\partial dW}{\partial y} \eta_x & -dR_{D66} \eta_x \\
  \frac{\partial dW}{\partial x} \eta_{px} & \frac{\partial dW}{\partial y} \eta_{px} & -(dR_{D66} + dW) \eta_{px} \\
  \frac{\partial dW}{\partial x} \eta_y & \frac{\partial dW}{\partial y} \eta_y & -dR_{D66} \eta_y \\
  \frac{\partial dW}{\partial x} \eta_{py} & \frac{\partial dW}{\partial y} \eta_{py} & -(dR_{D66} + dW) \eta_{py} \\
  -\frac{\partial dW}{\partial x} & -\frac{\partial dW}{\partial y} & dW
\end{pmatrix}
\begin{pmatrix}
  x_x \\
  p_x \\
  y \\
  p_y \\
  z \\
  \delta
\end{pmatrix},
\]

(116)

Then the local damping rates \(d\kappa_{x,y,z}\) are calculated by the diagonal parts of \(dR_D\):

\[

d\kappa_x = -\frac{dR_{D11} + dR_{D22}}{2} = \frac{1}{2} \left( dW - \frac{\partial dW}{\partial x} \eta_x \right),
\]

\[

d\kappa_y = -\frac{dR_{D33} + dR_{D44}}{2} = \frac{1}{2} \left( dW - \frac{\partial dW}{\partial y} \eta_y \right),
\]

\[

d\kappa_z = -\frac{dR_{D55} + dR_{D66}}{2} = \frac{1}{2} \left( \frac{\partial dW}{\partial x} \eta_x + \frac{\partial dW}{\partial y} \eta_y + 2dW \right),
\]

where we have used Eq. (111).
Effects of dispersion on damping (2)

The effect of radiation in the previous equation can be expressed by a matrix:

\[
\begin{pmatrix}
dx_B \\
dp_{xB} \\
dy_B \\
dp_{yB} \\
dz_B \\
d\delta
\end{pmatrix} = dR_D \begin{pmatrix}
x_B \\
p_{xB} \\
y_B \\
p_{yB} \\
z_B \\
d\delta
\end{pmatrix} = \begin{pmatrix}
dW \eta_x & \frac{\partial dW}{\partial y} \eta_x & \frac{\partial dW}{\partial \delta} \eta_x & -dR_{D66} \eta_x \\
\frac{\partial dW}{\partial x} \eta_x & dW \eta_y & \frac{\partial dW}{\partial \delta} \eta_y & -(dR_{D66} + dW) \eta_y \\
\frac{\partial dW}{\partial y} \eta_y & \frac{\partial dW}{\partial \delta} \eta_y & dW \eta_y & -(dR_{D66} + dW) \eta_y \\
-\frac{\partial dW}{\partial x} \eta_y & \frac{\partial dW}{\partial y} \eta_y & \frac{\partial dW}{\partial \delta} \eta_y & dW(\eta_x \eta_{px} + \eta_y \eta_{py}) \\
\end{pmatrix} \begin{pmatrix}
x_B \\
p_{xB} \\
y_B \\
p_{yB} \\
z_B \\
d\delta
\end{pmatrix},
\]

(116)

\[dR_{D66} = -\frac{\partial dW}{\partial x} \eta_x - \frac{\partial dW}{\partial y} \eta_y - \frac{\partial dW}{\partial \delta}.\]  

(117)

Then the local damping rates \(d\kappa_{x,y,z}\) are calculated by the diagonal parts of \(dR_D\):

\[d\kappa_x = -\frac{dR_{D11} + dR_{D22}}{2} = \frac{1}{2} \left(dW - \frac{\partial dW}{\partial x} \eta_x\right),\]

\[d\kappa_y = -\frac{dR_{D33} + dR_{D44}}{2} = \frac{1}{2} \left(dW - \frac{\partial dW}{\partial y} \eta_y\right),\]

\[d\kappa_z = -\frac{dR_{D55} + dR_{D66}}{2} = \frac{1}{2} \left(\frac{\partial dW}{\partial x} \eta_x + \frac{\partial dW}{\partial y} \eta_y + 2dW\right),\]

(118)

where we have used Eq. (111).

Note that \(d\kappa_x + d\kappa_y + d\kappa_z = 2dW\).
Radiation damping per revolution

We can integrate the local damping decrements Eq. (118) all over the ring to obtain the damping rate per revolution. We also assume there is no \( x-y \) coupling nor more complicated betatron-synchrotron couplings beyond that expressed by the dispersions.

\[
\begin{align*}
\frac{dk_x}{d\tau} &= -\frac{dR_{D11} + dR_{D22}}{2} = \frac{1}{2} \left( dW - \frac{\partial dW}{\partial x} \eta_x \right), \\
\frac{dk_y}{d\tau} &= -\frac{dR_{D33} + dR_{D44}}{2} = \frac{1}{2} \left( dW - \frac{\partial dW}{\partial y} \eta_y \right), \\
\frac{dk_z}{d\tau} &= -\frac{dR_{D55} + dR_{D66}}{2} = \frac{1}{2} \left( \frac{\partial dW}{\partial x} \eta_x + \frac{\partial dW}{\partial y} \eta_y + 2dW \right),
\end{align*}
\]
(118)
Radiation damping per revolution

We can integrate the local damping decrements Eq. (118) all over the ring to obtain the damping rate per revolution. We also assume there is no x-y coupling nor more complicated betatron-synchrotron couplings beyond that expressed by the dispersions.

The local momentum loss \( dW \) is expressed as

\[
dW = \frac{\langle N \rangle \langle u \rangle}{cP_d} = \frac{2}{3} \gamma_0^3 r_e e^2 (1 + \delta)^2 B^2 ds',
\]

(119)

\[
d\kappa_x = -\frac{dR_{D11} + dR_{D22}}{2} = \frac{1}{2} \left( dW - \frac{\partial dW}{\partial \eta_x} \eta_x \right),
\]

\[
d\kappa_y = -\frac{dR_{D33} + dR_{D44}}{2} = \frac{1}{2} \left( dW - \frac{\partial dW}{\partial \eta_y} \eta_y \right),
\]

\[
d\kappa_z = -\frac{dR_{D55} + dR_{D66}}{2} = \frac{1}{2} \left( \frac{\partial dW}{\partial \eta_x} \eta_x + \frac{\partial dW}{\partial \eta_y} \eta_y + 2dW \right),
\]

(118)
Radiation damping per revolution

We can integrate the local damping decrements Eq. (118) all over the ring to obtain the damping rate per revolution. We also assume there is no $x$-$y$ coupling nor more complicated betatron-synchrotron couplings beyond that expressed by the dispersions.

The local momentum loss $dW$ is expressed as

$$dW = \frac{\langle N \langle u \rangle}{c P_d}$$

$$= \frac{2}{3} \gamma^3 r_e e^2 (1 + \delta)^2 B^2 ds',$$

with the orbit length $ds'$

$$ds' = \left(1 + \frac{x}{\rho_x} + \frac{y}{\rho_y}\right) ds,$$

where $\rho_x = -P_d/eB_y$ and $\rho_y = P_d/eB_y$ are the bending radius in each plane, and $B^2 = B_x^2 + B_y^2$.

$$dk_x = -\frac{dR_{D11} + dR_{D22}}{2} = \frac{1}{2} \left( dW - \frac{\partial dW}{\partial x} \eta_x \right),$$

$$dk_y = -\frac{dR_{D33} + dR_{D44}}{2} = \frac{1}{2} \left( dW - \frac{\partial dW}{\partial y} \eta_y \right),$$

$$dk_z = -\frac{dR_{D55} + dR_{D66}}{2} = \frac{1}{2} \left( \frac{\partial dW}{\partial x} \eta_x + \frac{\partial dW}{\partial y} \eta_y + 2dW \right),$$

(118)
Radiation damping per revolution (2)

We obtain the derivatives of $dW$ in Eq. (118), on the standard orbit where $(x, p_x, y, p_y, z, \delta) = 0$. Using Eqs. (119,120), they are written as:

\[
\begin{align*}
\frac{dW}{dx} &= \frac{1}{\rho_x} + \frac{2B_y}{B^2} \frac{\partial B_y}{\partial x}, \\
\frac{dW}{dy} &= \frac{1}{\rho_y} + \frac{2B_x}{B^2} \frac{\partial B_x}{\partial y}, \\
\frac{dW}{\partial \delta} &= 2.
\end{align*}
\]
Radiation damping per revolution (2)

We obtain the derivatives of $dW$ in Eq. (118), on the standard orbit where $(x, p_x, y, p_y, z, \delta) = 0$. Using Eqs. (119,120), they are written as:

$$dW = \frac{2}{3} \gamma_0 r_e e^2 (1 + \delta)^2 B^2 ds', \quad (119)$$
$$ds' = \left(1 + \frac{x}{\rho_x} + \frac{y}{\rho_y}\right) ds \quad (120)$$

$$\begin{align*}
\frac{1}{2} \frac{\partial dW}{\partial x} &= \frac{1}{\rho_x} \frac{\partial}{\partial x} + \frac{2B_y}{B^2} \frac{\partial B_y}{\partial x}, \\
\frac{1}{2} \frac{\partial dW}{\partial y} &= \frac{1}{\rho_y} \frac{\partial}{\partial y} + \frac{2B_x}{B^2} \frac{\partial B_x}{\partial y}, \\
\frac{1}{2} \frac{\partial dW}{\partial \delta} &= 2. \quad (121, 122, 123)
\end{align*}$$

We have omitted skew-focusing components $\frac{\partial B_x}{\partial x}$ and $\frac{\partial B_y}{\partial y}$, which can cause $x$-$y$ coupling.
Radiation damping per revolution (2)

We obtain the derivatives of $dW$ in Eq. (118), on the standard orbit where $(x, p_x, y, p_y, z, \delta) = 0$. Using Eqs. (119,120), they are written as:

$$
\begin{align*}
  d\kappa_x &= -\frac{dR_{p11} + dR_{p22}}{2} = \frac{1}{2} \left( dW - \frac{\partial dW}{\partial x} \eta_x \right) , \\
  d\kappa_y &= -\frac{dR_{p31} + dR_{p44}}{2} = \frac{1}{2} \left( dW - \frac{\partial dW}{\partial y} \eta_y \right) , \\
  d\kappa_z &= -\frac{dR_{p55} + dR_{p66}}{2} = \frac{1}{2} \left( \frac{\partial dW}{\partial x} \eta_x + \frac{\partial dW}{\partial y} \eta_y + 2dW \right) , \\
  dW &= \frac{2}{3} \gamma_0 r_e e^2 (1 + \delta)^2 B^2 ds' , \quad (119) \\
  ds' &= \left( 1 + \frac{x}{\rho_x} + \frac{y}{\rho_y} \right) ds \quad (120)
\end{align*}
$$

We have omitted skew-focusing components $\frac{\partial B_x}{\partial x}$ and $\frac{\partial B_y}{\partial y}$, which can cause $x$-$y$ coupling.

Thus the damping decrement per revolution at the standard orbit becomes

$$
\begin{align*}
  \kappa_x &= \oint d\kappa_x = \oint \left( 1 - \frac{\eta_x}{\rho_x} - 2\eta_x \frac{B_y}{B^2} \frac{\partial B_y}{\partial x} \right) \frac{dW_d}{2} , \\
  \kappa_y &= \oint d\kappa_y = \oint \left( 1 - \frac{\eta_y}{\rho_y} - 2\eta_y \frac{B_x}{B^2} \frac{\partial B_x}{\partial y} \right) \frac{dW_d}{2} , \\
  \kappa_z &= \oint d\kappa_y = \oint \left( 2 + \frac{\eta_x}{\rho_x} + \frac{\eta_y}{\rho_y} + 2\eta_x \frac{B_y}{B^2} \frac{\partial B_y}{\partial x} + 2\eta_y \frac{B_x}{B^2} \frac{\partial B_x}{\partial y} \right) \frac{dW_d}{2} .
\end{align*}
$$

where $dW_d = \frac{C_y}{2\pi c} E_d \frac{1}{\rho^2} ds$, as shown in Eq. (96).

$$
U_0 = c P_d \oint dW_d = \frac{C_y}{2\pi} E_d^4 \oint \frac{1}{\rho^2} ds , \quad (91)
$$
Radiation damping per revolution (3)

These damping decrements are expressed in terms of damping partitions \( J_{x,y,z} \) as:

\[
\kappa_{x,y,z} = \frac{J_{x,y,z}}{2} \oint dW_d = \frac{J_{x,y,z}}{2} \frac{U_0}{cP_d}.
\]  

(127)

\[
\kappa_x = \oint d\kappa_x = \oint \left( 1 - \frac{\eta_x}{\rho_x} - 2\eta_x \frac{B_y}{B^2} \frac{\partial B_y}{\partial x} \right) \frac{dW_d}{2},
\]  

(124)

\[
\kappa_y = \oint d\kappa_y = \oint \left( 1 - \frac{\eta_y}{\rho_y} - 2\eta_y \frac{B_x}{B^2} \frac{\partial B_x}{\partial y} \right) \frac{dW_d}{2},
\]  

(125)

\[
\kappa_z = \oint d\kappa_z = \oint \left( 2 + \frac{\eta_x}{\rho_x} + \frac{\eta_y}{\rho_y} + 2\eta_x \frac{B_y}{B^2} \frac{\partial B_y}{\partial x} + 2\eta_y \frac{B_x}{B^2} \frac{\partial B_x}{\partial y} \right) \frac{dW_d}{2}.
\]  

(126)
Radiation damping per revolution (3)

These damping decrements are expressed in terms of damping partitions $J_{x,y,z}$ as:

$$
\kappa_{x,y,z} = \frac{J_{x,y,z}}{2} \int dW_d = \frac{J_{x,y,z}}{2} \frac{U_0}{cP_d} .
$$

(127)

Thus

$$
J_x + J_y + J_z = 4 .
$$

(128)

$$
\kappa_x = \oint d\kappa_x = \oint \left( 1 - \frac{\eta_x}{\rho_x} - 2\eta_x \frac{B_y \partial B_y}{B^2 \partial x} \right) \frac{dW_d}{2} ,
$$

(124)

$$
\kappa_y = \oint d\kappa_y = \oint \left( 1 - \frac{\eta_y}{\rho_y} - 2\eta_y \frac{B_x \partial B_x}{B^2 \partial y} \right) \frac{dW_d}{2} ,
$$

(125)

$$
\kappa_z = \oint d\kappa_y = \oint \left( 2 + \frac{\eta_x}{\rho_x} + \frac{\eta_y}{\rho_y} + 2\eta_x \frac{B_y \partial B_y}{B^2 \partial x} + 2\eta_y \frac{B_x \partial B_x}{B^2 \partial y} \right) \frac{dW_d}{2} .
$$

(126)
These damping decrements are expressed in terms of damping partitions $J_{x,y,z}$ as:

$$\kappa_{x,y,z} = \frac{J_{x,y,z}}{2} \int dW_d = \frac{J_{x,y,z} U_0}{2 cP_d}. \quad (127)$$

Thus

$$J_x + J_y + J_z = 4. \quad (128)$$

In the expressions in Eqs. (124–126), the terms with field gradients $\frac{2B_y \partial B_y}{B^2 \partial x}$ and $\frac{2B_x \partial B_x}{B^2 \partial y}$ are often zero, in the case of a ring consisting of flat dipoles ($\cdot B' = 0$) and separated quadrupoles ($\cdot B = 0$ at the design orbit). Also the ratio $\eta_x/\rho$ is usually small for a large machine. Then in such a case we can approximate as:

$$J_x \approx J_y \approx 1, \quad J_z \approx 2. \quad (129)$$

\[ \begin{align*}
\kappa_x &= \oint d\kappa_x = \oint \left( 1 - \frac{\eta_x}{\rho} - 2\eta_x \frac{B_y \partial B_y}{B^2 \partial x} \right) \frac{dW_d}{2}, \\
\kappa_y &= \oint d\kappa_y = \oint \left( 1 - \frac{\eta_y}{\rho} - 2\eta_y \frac{B_x \partial B_x}{B^2 \partial y} \right) \frac{dW_d}{2}, \\
\kappa_z &= \oint d\kappa_z = \oint \left( 2 + \frac{\eta_x}{\rho} + \frac{\eta_y}{\rho} + 2\eta_x \frac{B_y \partial B_y}{B^2 \partial x} + 2\eta_y \frac{B_x \partial B_x}{B^2 \partial y} \right) \frac{dW_d}{2}. \quad (126)
\end{align*} \]
Radiation damping per revolution (3)

These damping decrements are expressed in terms of damping partitions $J_{x,y,z}$ as:

$$\kappa_{x,y,z} = \frac{J_{x,y,z}}{2} \int dW_d = \frac{J_{x,y,z}}{2} \frac{U_0}{cP_d}.$$  \hspace{1cm} (127)

Thus

$$J_x + J_y + J_z = 4 \ .$$  \hspace{1cm} (128)

In the expressions in Eqs. (124–126), the terms with field gradients $\frac{2B_y \partial B_y}{B^2 \partial x}$ and $\frac{2B_x \partial B_x}{B^2 \partial y}$ are often zero, in the case of a ring consisting of flat dipoles ($\therefore B^' = 0$) and separated quadrupoles ($\therefore B = 0$ at the design orbit). Also the ratio $\eta_x/\rho$ is usually small for a large machine. Then in such a case we can approximate as:

$$J_x \approx J_y \approx 1, \quad J_z \approx 2 \ .$$  \hspace{1cm} (129)

More terms in the damping partitions can arise from the edge angle of a dipole. Also a non-zero closed orbit will change them.
Momentum spread

The stochastic nature of the synchrotron radiation generates beam emittance, which is the spread of particles in the phase space.

First let us look at the $z$-plane. From Eq. (94), we can write the increment of the square of momentum spread in a small section $ds$ as

$$dA_z = hN_i u^2 c^2 P^2 ds \propto \frac{\pi}{3}.$$ (130)

The momentum spread of the beam follows an equation of damping and excitation:

$$dn_z^2 = 2 \zeta z^2 + \frac{1}{2} I dA_z,$$ (131)

where $n$ is the number of turns.

The factor $1/2$ in front of the integral above comes from the synchrotron oscillation, where the average of $2$ is equal to $2^{\text{peak}}/2$. We have also assumed the synchrotron motion is slow ($\zeta \equiv \text{const.}$, $\zeta \equiv 0$).

Using Eq. (127), at the equilibrium the momentum spread becomes

$$n_z^2 = \frac{1}{4} \zeta I dA_0 = \frac{1}{2} J_z cP dU_0.$$ (132)

$$= Cq J_z 2^0 H_1/\zeta \equiv \frac{1}{2} ds,$$ (133)

where $Cq \equiv 55/32 p/3 mc^2 = 0.9923 \times 10^{-43}$.

These damping decrements are expressed in terms of damping partitions $J_x, y, z$ as:

$$\sum x, y, z = J_x, y, z 2^0 U_0 cP d.$$ (122)

Thus $J_x + J_y + J_z = 4/25.$ (123)

In the expressions in Eqs. (119–121), the terms with field gradients $\partial B_y/\partial x$ and $\partial B_x/\partial y$ are often zero, in the case of a ring consisting of flat dipoles ($B_0 = 0$) and separated quadrupoles ($B = 0$ at the design orbit). Also the ratio $\zeta_x/\zeta_y$ is usually small for a large machine. Then in such a case we can approximate as:

$$J_x \equiv J_y \equiv 1, J_z \equiv 2.$$ (124)

40

Momentum spread

Most basic characteristics of the radiation, concerning to the beam, are represented by the following formulas: The expected number of photons in a bending angle $\phi$:

$$hN_i = \frac{5}{2} p^3 \zeta.$$ (90)

The expected value of photon energy and the square of photon energy:

$$hu_i = \frac{8}{15} p^3 u, (91)$$

$$hu_i^2 = \frac{11}{27} u^2 c.$$ (92)

The expected energy loss per an angle $\phi$:

$$hE_i = hN_i u_i = \frac{55}{24} p^3 \zeta 7 mc^4 r e \zeta.$$ (93)

The expected energy spread per an angle $\phi$:

$$hE_i^2 = hE_i 2^0 hE^2_i = hN_i u^2_i = \frac{55}{24} p^3 \zeta 7 mc^4 r e \zeta^2.$$ (94)
Momentum spread

The stochastic nature of the synchrotron radiation generates beam emittance, which is the spread of particles in the phase space.

First let us look at the $z$-plane. From Eq. (94), we can write the increment of the square of momentum spread in a small section $ds$ as

$$dA_z = \frac{55}{24 \sqrt{3}} \frac{\gamma^2}{\alpha} m c^4 \left( \frac{r_e}{\rho} \right)^2 \phi . \quad (94)$$

$$dA_z = \frac{\langle N \rangle \langle u^2 \rangle}{c^2 P_d^2} = \frac{55}{24 \sqrt{3}} \gamma^5 r_e^2 \frac{ds}{\alpha |\rho|^3} \quad (130)$$

Most basic characteristics of the radiation, concerning to the beam, are represented by the following formulas: The expected number of photons in a bending angle

$$\langle N \rangle = \frac{55 \gamma^2}{24 \sqrt{3}} m c^4 \left( \frac{r_e}{\rho} \right)^2 .$$

The expected value of photon energy and the square of photon energy:

$$\langle u \rangle = \frac{8}{15} \frac{1}{\gamma^2} \frac{1}{\alpha} \frac{1}{|\rho|^3} \quad (91),$$

$$\langle u^2 \rangle = \frac{11}{27} \alpha^2 \frac{1}{|\rho|^3} . \quad (92)$$

The expected energy loss per an angle:

$$\langle E \rangle = \langle N \rangle \langle u \rangle = \frac{62}{3} \frac{1}{\alpha} \frac{1}{|\rho|^3} . \quad (93)$$

The expected energy spread per an angle:

$$\langle E^2 \rangle = \langle E \rangle^2 - \langle E \rangle^2 = \langle N \rangle \langle u^2 \rangle = \frac{55}{24 \sqrt{3}} \gamma^5 r_e^2 \frac{ds}{\alpha |\rho|^3} . \quad (94)$$
Momentum spread

The stochastic nature of the synchrotron radiation generates beam emittance, which is the spread of particles in the phase space.

First let us look at the $z$-plane. From Eq. (94), we can write the increment of the square of momentum spread in a small section $ds$ as

$$dA_z = \frac{\langle N \rangle \langle u^2 \rangle}{c^2 P_d^2} = \frac{55}{24 \sqrt{3}} \frac{\gamma^3 m^2 c^4 \left( \frac{r_e}{\rho} \right)^2}{\alpha} ds \phi . $$  \hspace{1cm} (94)

The momentum spread of the beam follows an equation of damping and excitation:

$$\frac{d\sigma^2}{dn} = -2 \kappa \sigma^2 \delta + \frac{1}{2} \int dA_z . $$  \hspace{1cm} (131)

where $n$ is the number of turns.
Momentum spread

The stochastic nature of the synchrotron radiation generates beam emittance, which is the spread of particles in the phase space.

First let us look at the \( z \)-plane. From Eq. (94), we can write the increment of the square of momentum spread in a small section \( ds \) as

\[
\begin{align*}
    dA_z &= \frac{55}{24 \sqrt{3}} \frac{\gamma^2}{\alpha} m^2 c^4 \left( \frac{r_z}{\rho} \right)^2 \phi. \\
    \text{(94)}
\end{align*}
\]

The momentum spread of the beam follows an equation of damping and excitation:

\[
\frac{d \sigma_\delta^2}{dn} = -2\kappa z \sigma_\delta^2 + \frac{1}{2} \int dA_z, \quad \text{(131)}
\]

where \( n \) is the number of turns.

The factor \( 1/2 \) in front of the integral above comes from the synchrotron oscillation, where the average of \( \sigma^2 \) is equal to \( \delta_\text{peak}^2 / 2 \). We have also assumed the synchrotron motion is slow (\( \beta_z \approx \text{const.}, \alpha_z \approx 0 \)).
Momentum spread

The stochastic nature of the synchrotron radiation generates beam emittance, which is the spread of particles in the phase space.

First let us look at the $z$-plane. From Eq. (94), we can write the increment of the square of momentum spread in a small section $ds$ as

$$dA_z = \frac{\langle N \rangle \langle u^2 \rangle}{c^2 P_d^2} = \frac{55}{24 \sqrt{3}} \frac{\gamma^2 r_e^2}{\alpha |\rho|^3} ds.$$ (130)

The momentum spread of the beam follows an equation of damping and excitation:

$$\frac{d\sigma^2_\delta}{dn} = -2\kappa_z \sigma^2_\delta + \frac{1}{2} \int dA_z,$$ (131)

where $n$ is the number of turns.

The factor $1/2$ in front of the integral above comes from the synchrotron oscillation, where the average of $\delta^2$ is equal to $\delta^2_{peak}/2$. We have also assumed the synchrotron motion is slow ($\beta_z \approx \text{const.}, \alpha_z \approx 0$).

Using Eq. (127), at the equilibrium the momentum spread becomes

$$\sigma^2_\delta = \frac{1}{4\kappa_z} \int dA_0 = \frac{1}{2J_z} \frac{cP_d}{U_0} \oint dA_z,$$ (132)

$$= \frac{C_q \gamma^2}{J_z} \oint \frac{1}{|\rho|^3} ds,$$ (133)

where $C_q \equiv \frac{55}{32 \sqrt{3} mc} = 0.9923 \gamma_e$. 

$$\kappa_{x,y,z} = \frac{1}{2} \oint dW_d = \frac{1}{2} \frac{J_{x,y,z} U_0}{cP_d}.$$ (122)
Transverse emittance

The transverse equilibrium emittance can be estimated in a similar way. In the normalized coordinate

\[ (u_x, p_{ux}) = \left( \frac{x}{\sqrt{\beta_x}}, \sqrt{\beta_x}p_x + \frac{\alpha_x}{\sqrt{\beta_x}}x \right), \quad (134) \]
Transverse emittance

The transverse equilibrium emittance can be estimated in a similar way. In the normalized coordinate

\[(u_x, p_{ux}) = \left( \frac{x}{\sqrt{\beta_x}}, \sqrt{\beta_x}p_x + \frac{\alpha_x}{\sqrt{\beta_x}}x \right), \quad (134)\]

the emittance is equal to the expected value \(\langle u_x^2 \rangle = \langle p_{ux}^2 \rangle\).
Transverse emittance

The transverse equilibrium emittance can be estimated in a similar way. In the normalized coordinate

\[ (u_x, p_{ux}) = \left( \frac{x}{\sqrt{\beta_x}}, \sqrt{\beta_x} p_x + \frac{\alpha_x}{\sqrt{\beta_x}} x \right), \]

the emittance is equal to the expected value \( \langle u_x^2 \rangle = \langle p_{ux}^2 \rangle \).

Then the excitation term \( dA_x \), corresponding to \( dA_z \) for \( z \)-plane is

\[ dA_x = \langle du_x^2 \rangle + \langle dp_{ux}^2 \rangle \]

(135)
Transverse emittance

The transverse equilibrium emittance can be estimated in a similar way. In the normalized coordinate

\[(u_x, p_{ux}) = \left( \frac{x}{\sqrt{\beta_x}}, \sqrt{\beta_x} p_x + \frac{\alpha_x}{\sqrt{\beta_x}} x \right), \]  

(134)

the emittance is equal to the expected value \( \langle u_x^2 \rangle = \langle p_{ux}^2 \rangle \).

Then the excitation term \( dA_x \), corresponding to \( dA_z \) for \( z \)-plane is

\[dA_x = \langle du_x^2 \rangle + \langle dp_{ux}^2 \rangle \]

(135)

\[= \gamma_x \langle dx_x^2 \rangle + \alpha_x \langle dx_{x\beta} dp_{x\beta} \rangle + \beta_x \langle dp_{x\beta}^2 \rangle, \]

(136)
Transverse emittance

The transverse equilibrium emittance can be estimated in a similar way. In the normalized coordinate

\[ (u_x, p_{ux}) = \left( \frac{x}{\sqrt{\beta_x}}, \sqrt{\beta_x}p_x + \frac{\alpha_x}{\sqrt{\beta_x}}x \right), \]  

(134)

the emittance is equal to the expected value \( \langle u_x^2 \rangle = \langle p_{ux}^2 \rangle \).

Then the excitation term \( dA_x \), corresponding to \( dA_z \) for \( z \)-plane is

\[
\begin{align*}
    dA_x &= \langle du_x^2 \rangle + \langle dp_{ux}^2 \rangle \\
    &= \gamma_x \langle dx^2 \rangle + \alpha_x \langle dx_pdp_{x\beta} \rangle + \beta_x \langle dp_{x\beta}^2 \rangle, \\
    &= \left( \gamma_x \eta_x^2 + 2\alpha_x \eta_x \eta_{px} + \beta_x \eta_{px}^2 \right) \langle d\delta^2 \rangle.
\end{align*}
\]

(135)  (136)  (137)
Transverse emittance

The transverse equilibrium emittance can be estimated in a similar way. In the normalized coordinate

\[(u_x, p_{ux}) = \left( \frac{x}{\sqrt{\beta_x}}, \sqrt{\beta_x} p_x + \frac{\alpha_x}{\sqrt{\beta_x}} x \right), \tag{134}\]

the emittance is equal to the expected value \(\langle u_x^2 \rangle = \langle p_{ux}^2 \rangle\).

Then the excitation term \(dA_x\), corresponding to \(dA_z\) for \(z\)-plane is

\[
dA_x = \langle du_x^2 \rangle + \langle dp_{ux}^2 \rangle \tag{135}
\]

\[
= \gamma_x \langle dx_{\beta}^2 \rangle + \alpha_x \langle dx_{\beta} dp_{x\beta} \rangle + \beta_x \langle dp_{x\beta}^2 \rangle, \tag{136}
\]

\[
= \left( \gamma_x \eta_x^2 + 2\alpha_x \eta_x \eta_{px} + \beta_x \eta_{ppx}^2 \right) \langle d\delta^2 \rangle, \tag{137}
\]

\[
= \mathcal{H}_x \langle d\delta^2 \rangle, \tag{138}
\]

where \(\gamma_x = (1 + \alpha_x^2)/\beta_x\), and we have used \(dx_{\beta} = -\eta_x d\delta\) and \(dp_{x\beta} = -\eta_{px} d\delta\). Then in a similar way as the \(z\)-plane, the equilibrium emittance can be obtained as
Transverse emittance

The transverse equilibrium emittance can be estimated in a similar way. In the normalized coordinate

\[(u_x, p_{ux}) = \left( \frac{x}{\sqrt{\beta_x}}, \sqrt{\beta_x} p_x + \frac{\alpha_x}{\sqrt{\beta_x}} x \right), \tag{134}\]

the emittance is equal to the expected value \(\langle u_x^2 \rangle = \langle p_{ux}^2 \rangle\).

Then the excitation term \(dA_x\), corresponding to \(dA_z\) for \(z\)-plane is

\[dA_x = \langle du_x^2 \rangle + \langle dp_{ux}^2 \rangle \tag{135}\]
\[= \gamma_x \langle dx_x^2 \rangle + \alpha_x \langle dx_x dp_{x\beta} \rangle + \beta_x \langle dp_{x\beta}^2 \rangle, \tag{136}\]
\[= \left( \gamma_x \eta_x^2 + 2\alpha_x \eta_x \eta_{px} + \beta_x \eta_{px}^2 \right) \langle d\delta^2 \rangle \tag{137}\]
\[= \mathcal{H}_x \langle d\delta^2 \rangle \tag{138}\]

where \(\gamma_x = (1 + \alpha_x^2)/\beta_x\), and we have used \(dx_\beta = -\eta_x d\delta\) and \(dp_{x\beta} = -\eta_{px} d\delta\). Then in a similar way as the \(z\)-plane, the equilibrium emittance can be obtained as

\[\varepsilon_{x,y} = \frac{1}{4k_{x,y}} \oint dA_{x,y} = \frac{1}{2J_{x,y}} \frac{cP_d}{U_0} \oint dA_{x,y} \]
\[= \frac{C_d}{J_{x,y}} \frac{\mathcal{H}_{x,y} / \rho^3}{\oint 1/p^2 ds}, \tag{139}\]

where

\[\mathcal{H}_{x,y} \equiv \gamma_{x,y} \eta_{x,y}^2 + 2\alpha_{x,y} \eta_{x,y} \eta_{px,py} + \beta_{x,y} \eta_{px,py}^2. \tag{140}\]
Longitudinal emittance

The result for the transverse equilibrium emittance Eq. (139) is extendable to $z$-plane as:

$$\varepsilon_z = \frac{C_q}{J_z} \gamma_0^2 \frac{\oint H_z/|\rho|^3 ds}{\oint 1/\rho^2 ds}, \quad (141)$$

with
Longitudinal emittance

The result for the transverse equilibrium emittance Eq. (139) is extendable to $z$-plane as:

$$
\varepsilon_z = \frac{C_q}{J_z} \gamma_0^2 \frac{\oint H_z/|\rho|^3 ds}{\oint 1/\rho^2 ds},
$$

(141)

with

$$
H_z \equiv \gamma_z \eta_z^2 + 2\alpha_{x,y} \eta_z \eta_\delta + \beta_z \eta_\delta^2
$$

(142)

$$
\approx \beta_z,
$$

(143)

where we have used $\eta_\delta = 1$ and $\eta_z \approx 0$. 

Longitudinal emittance

The result for the transverse equilibrium emittance Eq. (139) is extendable to $z$-plane as:

$$\varepsilon_z = \frac{C_q}{J_z \gamma_0} \frac{\int \mathcal{H}_z / |\rho|^3 ds}{\int 1/\rho^2 ds},$$  \hspace{1cm} (141)

with

$$\mathcal{H}_z \equiv \gamma_z \eta_z^2 + 2\alpha_{x,y} \eta_z \eta_\delta + \beta_z \eta_\delta^2 \approx \beta_z,$$ \hspace{1cm} (142)

where we have used $\eta_\delta = 1$ and $\eta_z \approx 0$.

From the emittance, the resulting bunch length and the energy spread are written as

$$\sigma_z^2 = \beta_z \varepsilon_z,$$ \hspace{1cm} (144)

$$\sigma_\delta^2 = \gamma_z \varepsilon_z = \frac{1 + \alpha_z^2}{\beta_z} \varepsilon_z.$$

(145)

In the case of a slow synchrotron motion, above agree with previous results by setting $\beta_z \approx \text{const.} = -\frac{\bar{\alpha}_p}{\mu_z} C$ as in Eq. (86).
x-y coupling

- The expression for the vertical equilibrium emittance Eq. (139) is only true when the x-y coupling is zero. It is no longer correct under x-y coupling.

\[
\varepsilon_{x,y} = \frac{C_4}{J_{x,y}} \frac{\int \mathcal{H}_{x,y} |\rho|^2 ds}{\int 1/\rho^2 ds},
\]

(139)

\[
\mathcal{H}_{x,y} \equiv \gamma_{x,y} \eta_{x,y}^2 + 2\alpha_{x,y} \eta_{x,y} \eta_{px,py} + \beta_{x,y} \eta_{px,py}^2
\]
There are several ways to express such betatron coordinates (128), (129), and (130).

On the other hand, the vertical emittance can be increased depending on the

where

$x-y$ coupling

The expression for the vertical equilibrium emittance Eq. (139) is only true

when the $x-y$ coupling is zero. It is no longer correct under $x-y$ coupling.

For instance, if we put a skew quadrupole in a dispersion-free region of a

perfect ring with zero vertical dispersion, the vertical dispersion still remains

zero.

\[
\epsilon_{x,y} = \frac{C_{x,y}}{J_{x,y}} \frac{\int \mathcal{H}_{x,y}/|\rho|^3 \, ds}{\int 1/\rho^2 \, ds},
\]

(139)

\[
\mathcal{H}_{x,y} \equiv \gamma_{x,y} \eta_{x,y}^2 + 2\alpha_{x,y} \eta_{x,y} \eta_{px,py} + \beta_{x,y} \eta_{px,py}^2
\]
**x-y coupling**

- The expression for the vertical equilibrium emittance Eq. (139) is only true when the x-y coupling is zero. It is no longer correct under x-y coupling.

- For instance, if we put a skew quadrupole in a dispersion-free region of a perfect ring with zero vertical dispersion, the vertical dispersion still remains zero.

- On the other hand, the vertical emittance can be increased depending on the magnitude of the skew quadrupole.

\[
\varepsilon_{x,y} = \frac{C_4}{J_{x,y}} \frac{\oint \mathcal{H}_{x,y} |\rho|^3 ds}{\oint 1/\rho^2 ds},
\]

(139)
x-y coupling

- The expression for the vertical equilibrium emittance Eq. (139) is only true when the x-y coupling is zero. It is no longer correct under x-y coupling.
- For instance, if we put a skew quadrupole in a dispersion-free region of a perfect ring with zero vertical dispersion, the vertical dispersion still remains zero.
- On the other hand, the vertical emittance can be increased depending on the magnitude of the skew quadrupole.
- Thus the expression $\mathcal{H}_t$ should not refer the dispersions in the physical coordinate, but the dispersions in the betatron coordinate.

\[ \varepsilon_{x,y} = \frac{C_q}{J_{x,y}} \gamma_0 \frac{\int \mathcal{H}_{x,y} |\rho|^3 ds}{\int 1/\rho^2 ds}, \quad (139) \]
\[ \mathcal{H}_{x,y} \equiv \gamma_{x,y} \eta_{x,y}^2 + 2\alpha_{x,y} \eta_{x,y} \eta_{px,py} + \beta_{x,y} \eta_{px,py}^2 \]
• The expression for the vertical equilibrium emittance Eq. (139) is only true when the x-y coupling is zero. It is no longer correct under x-y coupling.

• For instance, if we put a skew quadrupole in a dispersion-free region of a perfect ring with zero vertical dispersion, the vertical dispersion still remains zero.

• On the other hand, the vertical emittance can be increased depending on the magnitude of the skew quadrupole.

• Thus the expression $\mathcal{H}_\top$ should not refer the dispersions in the physical coordinate, but the dispersions in the betatron coordinate.

There are several ways to express such betatron coordinates $(u, p_u, v, p_v)$. One way is

$$\begin{pmatrix} u \\ p_u \\ v \\ p_v \end{pmatrix} = R \begin{pmatrix} x \\ p_x \\ y \\ p_y \end{pmatrix} = \begin{pmatrix} \mu & -r_4 & r_2 \\ . & \mu & r_3 & -r_1 \\ r_1 & r_2 & \mu & . \\ r_3 & r_4 & . & \mu \end{pmatrix} \begin{pmatrix} x \\ p_x \\ y \\ p_y \end{pmatrix}, \quad (146)$$

where $r_{1,2,3,4}$ are the coupling coefficients at each location $s$ and $\mu^2 + (r_1r_4 - r_2r_3) = 1$.

$$\varepsilon_{x,y} = \frac{C_4}{J_{x,y}} \frac{\int \mathcal{H}_{x,y} |\rho|^2 ds}{\int 1/\rho^2 ds}, \quad (139)$$

$$\mathcal{H}_{x,y} \equiv \gamma_{x,y} \eta_{x,y}^2 + 2 \alpha_{x,y} \eta_{x,y} \eta_{p_x, p_y} + \beta_{x,y} \eta_{p_x, p_y}^2$$
Then for the function $\mathcal{H}$ we should use dispersions for $(u, p_u, v, p_v)$, i.e.,

$$
\begin{pmatrix}
\eta_u \\
\eta_{pu} \\
\eta_v \\
\eta_{pv}
\end{pmatrix} = R
\begin{pmatrix}
\eta_x \\
\eta_{px} \\
\eta_y \\
\eta_{py}
\end{pmatrix} =
\begin{pmatrix}
\mu & -r_4 & r_2 \\
. & \mu & r_3 & -r_1 \\
r_1 & r_2 & \mu & . \\
r_3 & r_4 & . & \mu
\end{pmatrix}
\begin{pmatrix}
\eta_x \\
\eta_{px} \\
\eta_y \\
\eta_{py}
\end{pmatrix},
$$

(147)
Then for the function $\mathcal{H}$ we should use dispersions for $(u, p_u, v, p_v)$, it ie.,

$$
\begin{pmatrix}
\eta_u \\
\eta_{pu} \\
\eta_v \\
\eta_{pv}
\end{pmatrix} = R
\begin{pmatrix}
\eta_x \\
\eta_{px} \\
\eta_y \\
\eta_{py}
\end{pmatrix} =
\begin{pmatrix}
\mu & -r_4 & r_2 \\
. & \mu & r_3 & -r_1 \\
r_1 & r_2 & \mu & . \\
r_3 & r_4 & . & \mu
\end{pmatrix}
\begin{pmatrix}
\eta_x \\
\eta_{px} \\
\eta_y \\
\eta_{py}
\end{pmatrix},
$$

(147)

Thus even with $\eta_y = \eta_{py} = 0$, the dispersions in the normal coordinates can be nonzero due to the $x$-$y$ coupling.
Then for the function $H$ we should use dispersions for $(u, p_u, v, p_v)$, i.e.,

$$
\begin{pmatrix}
\eta_u \\
\eta_{pu} \\
\eta_v \\
\eta_{pv}
\end{pmatrix}
= R
\begin{pmatrix}
\eta_x \\
\eta_{px} \\
\eta_y \\
\eta_{py}
\end{pmatrix}
= \begin{pmatrix}
\mu & -r_4 & r_2 \\
\mu & r_3 & -r_1 \\
r_1 & r_2 & \mu \\
r_3 & r_4 & \mu
\end{pmatrix}
\begin{pmatrix}
\eta_x \\
\eta_{px} \\
\eta_y \\
\eta_{py}
\end{pmatrix}, \tag{147}
$$

Thus even with $\eta_y = \eta_{py} = 0$, the dispersions in the normal coordinates can be nonzero due to the $x$-$y$ coupling.

- Practically such an $x$-$y$ coupling can arise from the vertical offset of sextupoles, which generates skew quadrupole components.
\textbf{x-y coupling (2)}

Then for the function $\mathcal{H}$ we should use dispersions for $(u, p_u, v, p_v)$, i.e.,

$$\begin{pmatrix} \eta_u \\ \eta_{pu} \\ \eta_v \\ \eta_{pv} \end{pmatrix} = R \begin{pmatrix} \eta_x \\ \eta_{px} \\ \eta_y \\ \eta_{py} \end{pmatrix} = \begin{pmatrix} \mu & -r_4 & r_2 \\ . & \mu & r_3 & -r_1 \\ r_1 & r_2 & \mu & . \\ r_3 & r_4 & . & \mu \end{pmatrix} \begin{pmatrix} \eta_x \\ \eta_{px} \\ \eta_y \\ \eta_{py} \end{pmatrix}, \quad (147)$$

Thus even with $\eta_y = \eta_{py} = 0$, the dispersions in the normal coordinates can be nonzero due to the $x$-$y$ coupling.

- Practically such an $x$-$y$ coupling can arise from the vertical offset of sextupoles, which generates skew quadrupole components.

- Usually a sextupole is placed at a location with non-zero horizontal dispersion for the chromaticity correction, then such a vertical offset also produces the vertical dispersion.
Then for the function $H$ we should use dispersions for $(u, p_u, v, p_v)$, i.e.,

$$
\begin{pmatrix}
\eta_u \\
\eta_{pu} \\
\eta_v \\
\eta_{pv}
\end{pmatrix} = R
\begin{pmatrix}
\eta_x \\
\eta_{px} \\
\eta_y \\
\eta_{py}
\end{pmatrix} =
\begin{pmatrix}
\mu & -r_4 & r_2 \\
. & \mu & r_3 & -r_1 \\
1 & r_2 & \mu & . \\
r_3 & r_4 & . & \mu
\end{pmatrix}
\begin{pmatrix}
\eta_x \\
\eta_{px} \\
\eta_y \\
\eta_{py}
\end{pmatrix},
$$

(147)

Thus even with $\eta_y = \eta_{py} = 0$, the dispersions in the normal coordinates can be nonzero due to the $x$-$y$ coupling.

- Practically such an $x$-$y$ coupling can arise from the vertical offset of sextupoles, which generates skew quadrupole components.
- Usually a sextupole is placed at a location with non-zero horizontal dispersion for the chromaticity correction, then such a vertical offset also produces the vertical dispersion.
- Thus to reduce the vertical emittance, correcting the vertical dispersion is not enough and $x$-$y$ coupling correction through the ring is necessary.
Under the presence of $x$-$y$ coupling, the vertical emittance can increase even with zero (physical) vertical dispersion.
Under the presence of $x$-$y$ coupling, the vertical emittance can increase even with zero (physical) vertical dispersion.
Under the presence of x-y coupling, the vertical emittance can increase even with zero (physical) vertical dispersion.
x-y coupling (3)

Under the presence of x-y coupling, the vertical emittance can increase even with zero (physical) vertical dispersion.

Skew quadrupole (SK1)

Emittance ratio

physical dispersion

normal mode dispersion
Emittance by the opening angle of photons

Usually for a vertical direction in a flat storage ring, the design vertical dispersion is zero and there is no $x$-$y$ coupling in the ring. Then the vertical emittance given by Eq. (139) becomes zero.

\[
\varepsilon_{x,y} = \frac{C_4}{J_{xy}} \frac{\int \mathcal{H}_{x,y}/|\rho|^3 \, ds}{\int 1/\rho^2 \, ds}, \tag{139}
\]

\[
\mathcal{H}_{x,y} \equiv \gamma_{x,y} \eta_{x,y}^2 + 2\alpha_{x,y} \eta_{x,y} \eta_{px,py} + \beta_{x,y} \eta_{px,py}^2
\]
Emittance by the opening angle of photons

Usually for a vertical direction in a flat storage ring, the design vertical dispersion is zero and there is no $x$-$y$ coupling in the ring. Then the vertical emittance given by Eq. (139) becomes zero.

In such a case, the vertical emittance due to the angular fluctuation of photons becomes the ultimate limit of the vertical emittance. The change of action $2dS_{y0}$ is given as in Eq. (136):

$$dA_{y,1/y} = \beta_y \langle d\delta^2 / \gamma^2 \rangle,$$

assuming the emitted photons have angular divergence $\sim 1/\gamma$.

$$dA_x = \gamma_x \langle dx_p^2 \rangle + \alpha_x \langle dx_p dp_y \rangle + \beta_x \langle dp_x^2 \rangle,$$

$$\varepsilon_{x,y} = \frac{C_4}{J_{x y}} \frac{\int H_{x,y} |\rho|^3 ds}{\int 1/\rho^2 ds},$$

$$H_{x,y} \equiv \gamma_{x,y} \eta_{x,y}^2 + 2\alpha_{x,y} \eta_{x,y} \eta_{p,x,p,y} + \beta_{x,y} \eta_{p,x,p,y}^2.$$
Emittance by the opening angle of photons

Usually for a vertical direction in a flat storage ring, the design vertical dispersion is zero and there is no x-y coupling in the ring. Then the vertical emittance given by Eq. (139) becomes zero.

In such a case, the vertical emittance due to the angular fluctuation of photons becomes the ultimate limit of the vertical emittance. The change of action $2dS_{y0}$ is given as in Eq. (136):

$$dA_{y,1/y} = \beta_\gamma \langle d\delta^2 / \gamma^2 \rangle,$$  \hspace{1cm} (148)

assuming the emitted photons have angular divergence $\sim 1 / \gamma$.

Then the equilibrium vertical emittance is

$$\varepsilon_{y,1/y} = \frac{C_q}{J_y} \int_0^\gamma \frac{\beta_\gamma |\rho|^3 \, ds}{\int 1/\rho^2 \, ds}. \hspace{1cm} (149)$$

$$dA_x = \gamma_x \langle dx^2_p \rangle + \alpha_x \langle dx_p dp_x \rangle + \beta_x \langle dp_x^2 \rangle,$$  \hspace{1cm} (136)

$$\varepsilon_{x,y} = \frac{C_q}{J_{xy}} \int \frac{\mathcal{H}_{x,y} |\rho|^3 \, ds}{\int 1/\rho^2 \, ds}, \hspace{1cm} (139)$$

$$\mathcal{H}_{x,y} = \gamma_{x,y} \eta^2_{x,y} + 2\alpha_{x,y} \eta_{x,y} \eta_{px,py} + \beta_{x,y} \eta^2_{px,py}. $$
Emittance by the opening angle of photons

Usually for a vertical direction in a flat storage ring, the design vertical dispersion is zero and there is no \( x-y \) coupling in the ring. Then the vertical emittance given by Eq. (139) becomes zero.

In such a case, the vertical emittance due to the angular fluctuation of photons becomes the ultimate limit of the vertical emittance. The change of action \( 2dS_{y0} \) is given as in Eq. (136):

\[
dA_{y,1/Y} = \beta_y \langle d\delta^2 / \gamma^2 \rangle ,
\]

assuming the emitted photons have angular divergence \( \sim 1/\gamma \).

Then the equilibrium vertical emittance is

\[
\varepsilon_{y,1/\gamma} = \frac{C_q \int \beta_y / |\rho|^3 ds}{J_y \int 1/|\rho|^2 ds} .
\]

(149)

In the case of uniform bending radius \( \rho = \rho_0 \),

\[
\varepsilon_{y,1/\gamma} = \frac{C_q \langle \beta_y \rangle}{J_y \rho_0} \approx \frac{\lambda_e \langle \beta_y \rangle}{J_y \rho_0} .
\]

(150)

Interestingly, this limit on the vertical emittance does not explicitly depend on the beam energy. Anyway the value is more important for a small ring.

\[
dA_x = \gamma_x \langle dx_y^2 \rangle + \alpha_x \langle dx_p d\eta_{px} \rangle + \beta_x \langle d\eta_{py}^2 \rangle ,
\]

(136)

\[
\varepsilon_{x,y} = \frac{C_q \gamma_0}{\int J_{xy}} \frac{\mathcal{H}_{x,y} / |\rho|^3 ds}{\int 1/|\rho|^2 ds} .
\]

(139)

\[\mathcal{H}_{x,y} \equiv \gamma_{x,y} \eta_{x,y}^2 + 2\alpha_{x,y} \eta_{x,y} \eta_{px,py} + \beta_{x,y} \eta_{px,py}^2\]
Synchrotron radiation integrals

We can summarize these formulas related to synchrotron radiation in terms of radiation integrals defined by:

\[
I_1 \equiv \int \left( \frac{\eta_x}{\rho_x} + \frac{\eta_y}{\rho_y} \right) ds,
I_2 \equiv \int \frac{1}{\rho^2} ds,
I_3 \equiv \int \frac{1}{|\rho|^3} ds,
I_{4x} \equiv \int \eta_x \left( \frac{1}{\rho_x} + 2 \frac{B_y}{B^2} \frac{\partial B_y}{\partial x} \right) ds,
I_{4y} \equiv \int \eta_y \left( \frac{1}{\rho_y} + 2 \frac{B_x}{B^2} \frac{\partial B_x}{\partial y} \right) ds,
I_{5x,y} \equiv \int \frac{\mathcal{H}_{x,y}}{|\rho|^3} ds.
\]

(144)

Then we can write as:

\[
\alpha_p = \frac{I_1}{C},
U_0 = \frac{C_y}{2\pi} E_d^4 I_2 ,
\]

(145)

\[
J_{x,y} = 1 - \frac{I_{4x,y}}{I_2} ,
J_z = 4 - J_x - J_y = 2 + \frac{I_{4x} + I_{4y}}{I_2} ,
\]

(146)

\[
\kappa_{x,y,z} = \frac{J_{x,y,z}}{2} \frac{U_0}{c P_d} ,
\]

(147)

\[
\sigma^2_\delta = \frac{C_q}{J_z} \frac{\gamma^2_0 I_3}{I_2} ,
\varepsilon_{x,y} = \frac{C_q}{J_{x,y}} \gamma^2_0 \frac{I_{5x,y}}{I_2} .
\]
