Electromagnetic Theory II

G. Franchetti, GSI CERN Accelerator – School 2-14 / 10 / 2016

Dielectrics

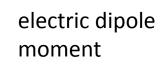

Dielectrics and electric field

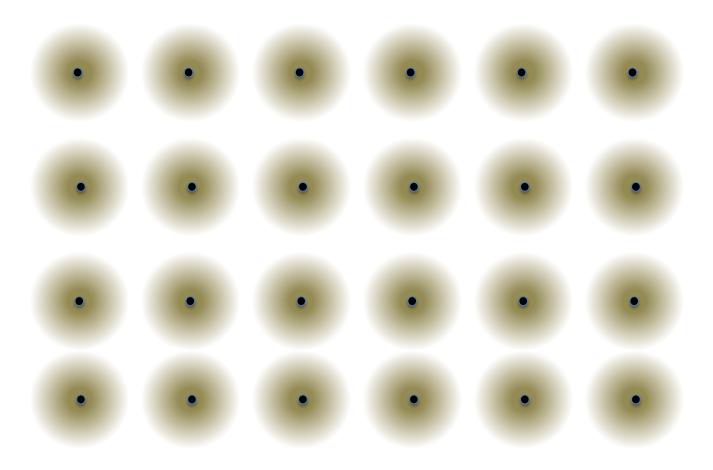

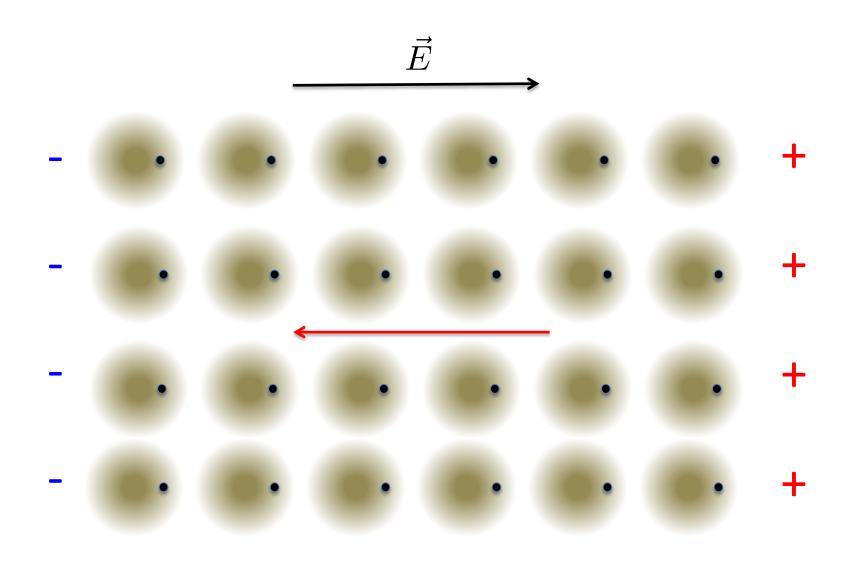

+

S

$$\vec{p} = q\vec{s}$$

Polarization

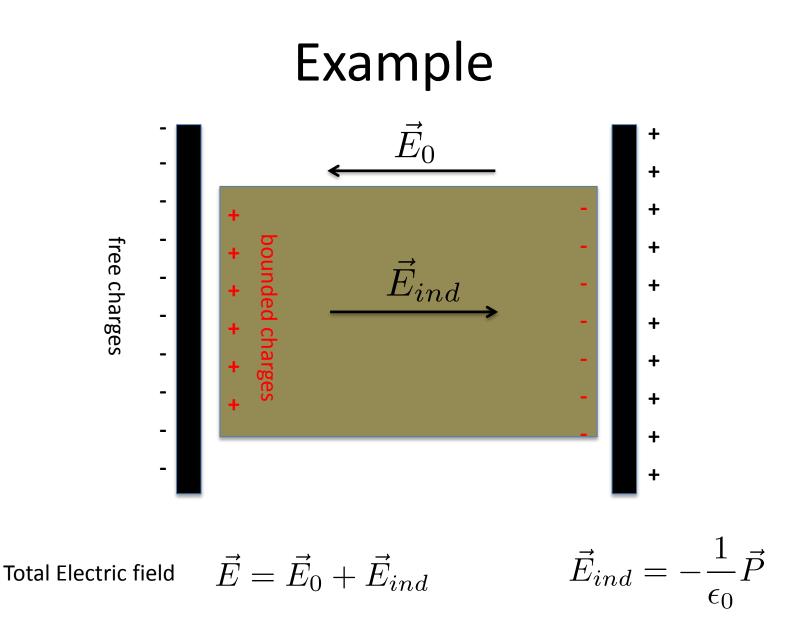

For homogeneous isotropic dielectrics

$$\vec{P} = \chi \epsilon_0 \vec{E}$$

 $\vec{P}~~$ polarization ightarrow number of electric dipole moment per volume

 $ec{E}$ electric field "in" the dielectric

Field internal to the capacitor

relative permettivity

$$\epsilon_r = 1 + \chi$$

Material	${\boldsymbol{\varepsilon}}_r$	
Vacuum	1	
Mica	3-6	
Glass	4.7	
water	80	
Calcium copper titanate	250000	

Electric Displacement

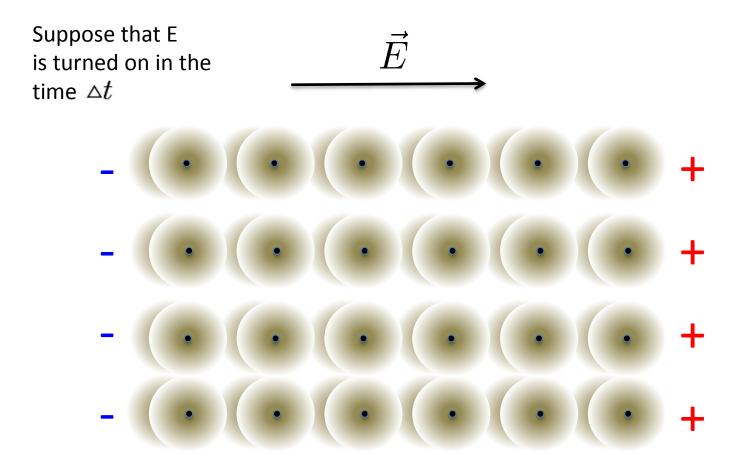

Field E₀ depends only on free charges

$$\epsilon_0 \vec{E}_0 = \epsilon_0 \vec{E} + \vec{P}$$

We give a special name: electric displacement

$$\vec{D} = \epsilon_0 \vec{E} + \vec{P} \quad \rightarrow \vec{D} = \epsilon \vec{E} = \epsilon_0 \epsilon_r \vec{E}$$
 first Maxwell equation $\vec{\nabla} \cdot \vec{D} = \rho_f$

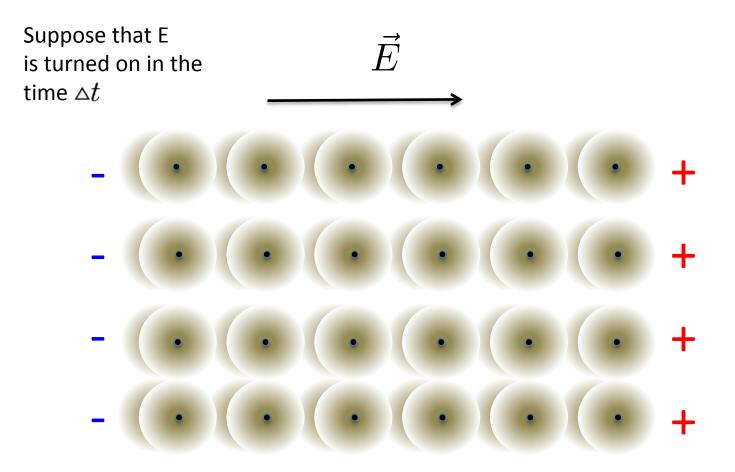

Bounded current

The polarization changes with time

G. Franchetti

Bounded current

The polarization changes with time

G. Franchetti

Single electric dipole moment

$$\vec{p} = q\vec{s}$$

$$\frac{\partial}{\partial t}\vec{P} = Nq\frac{d\vec{s}}{dt} = \vec{J_b}$$

Density of current due to bounded charges

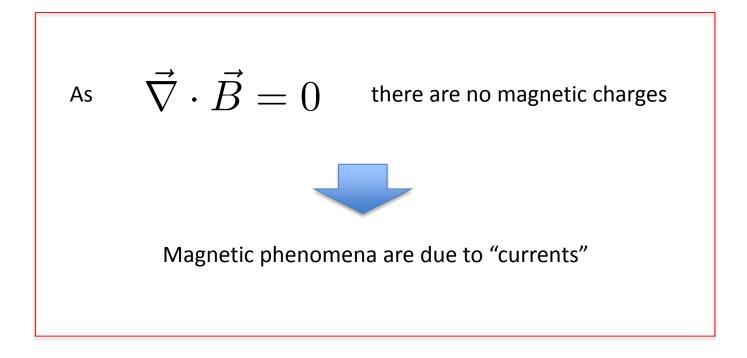

N = number of dipole moments Per volume

It has to be included in the Maxwell equation

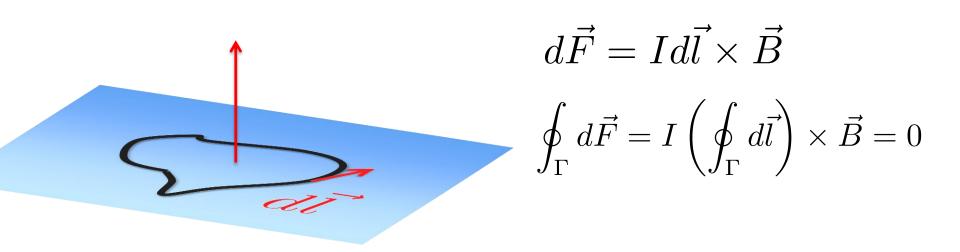

It is already in the definition of \vec{D}

Magnetic field in matter

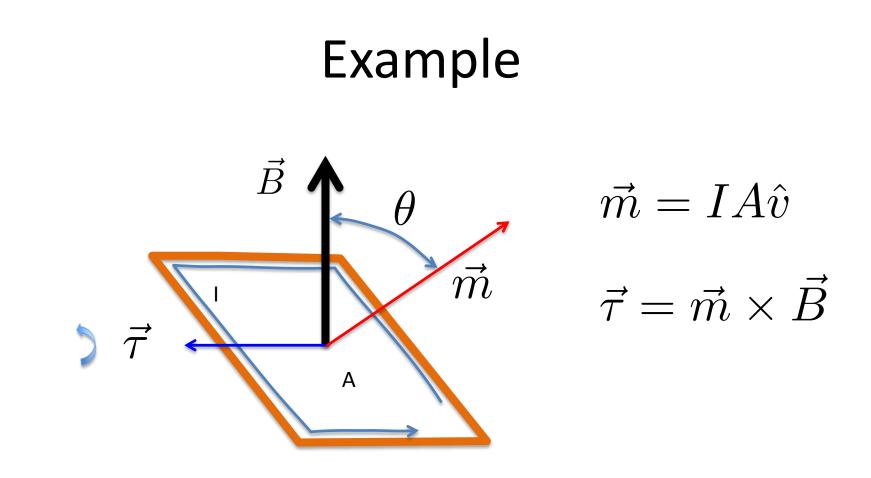

Magnetic moment

$$\oint_{\Gamma} \vec{r} \times d\vec{F} = I \oint \vec{r} \times \left(d\vec{l} \times \vec{B} \right) = \vec{m} \times \vec{B}$$

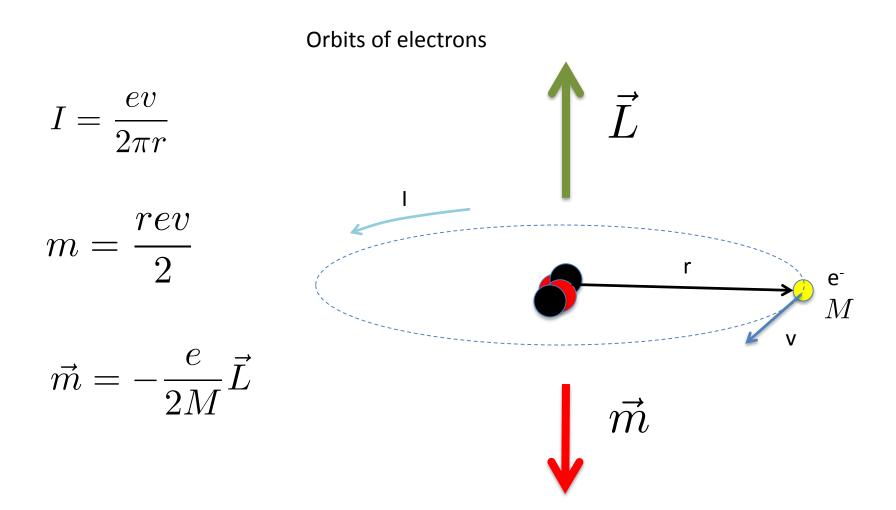

Magnetic moment

torque acting on the coil

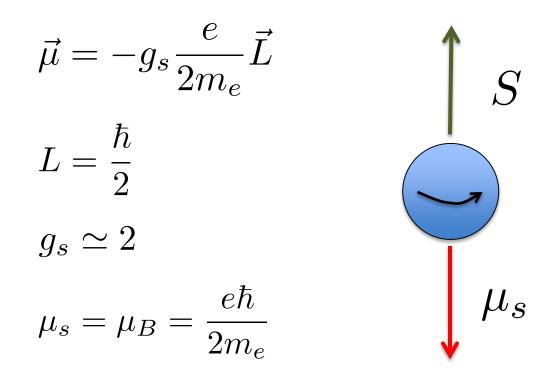

The effect of the magnetic field is to create a torque on the coil

Magnetic moments in matters

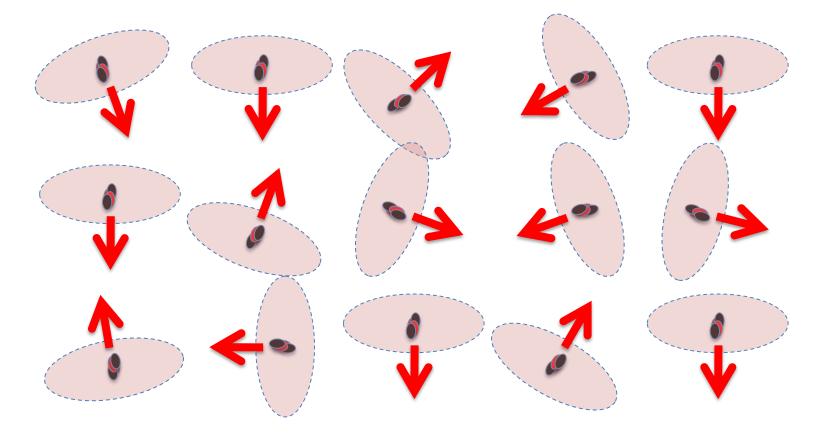

Intrinsic magnetic moments: ferromagnetism

Spin of electrons

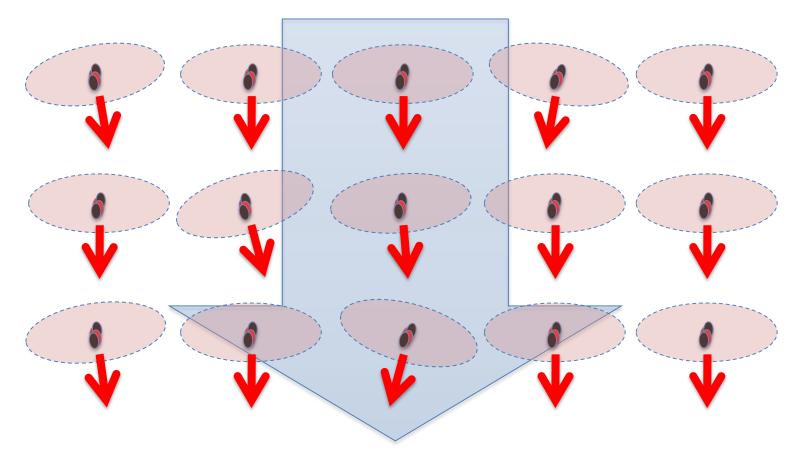

Without external magnetic field

Random orientation (due to thermal motion)

Without external magnetic field

dipoles moment of atoms orientates according to the external magnetic field

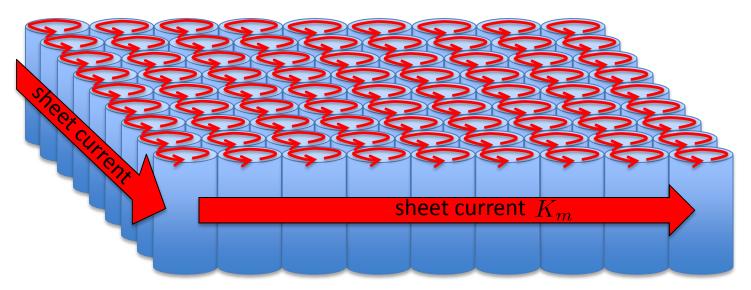

Magnetization

 $\vec{M} = \overline{\chi}_m \vec{B}$

B is the macroscopic magnetic field in the matter

 χ_m = magnetic susceptibility

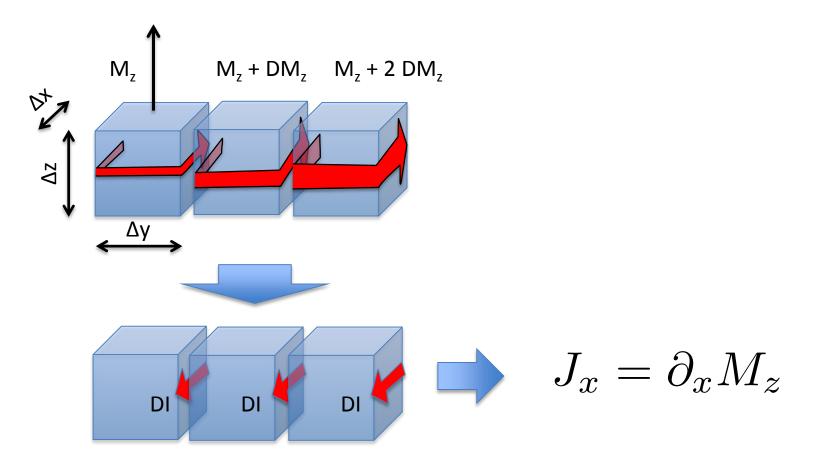

20

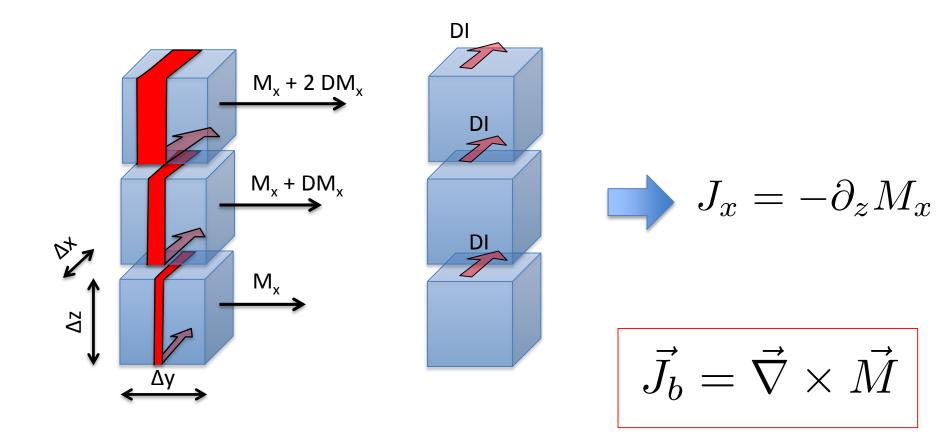

This surface current produces the magnetic field produced by magnetized matter $\vec{K}_m=\hat{n}\times\vec{M}$

G. Franchetti

Non uniform magnetization

Non uniform magnetization

Free currents and bounded currents

The bounded currents are given by

$$\vec{J_b} = \vec{\nabla} \times \vec{M}$$

This current should be included in Ampere's Law

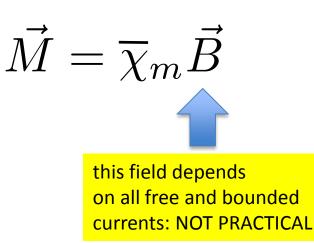

$$\vec{\nabla} \times \vec{B} = \mu_0 (\vec{J_f} + \vec{J_b})$$

$$\vec{\nabla} \times (\vec{B} - \mu_0 \vec{M}) = \mu_0 \vec{J}_f$$

De

fine
$$ec{H}=rac{1}{\mu_0}ec{B}-ec{M}$$
 $\label{eq:constraint}$ $ec{
abla} imesec{H}=ec{J}_f$

Magnetic susceptibility

$$\vec{M} = \chi_m \vec{H}$$

this field depends only on the current that I create

Material	χ_m	μ_{r}	μ
Vacuum	0	1	$4\pi \times 10^{-7}$
water	-8.0×10 ⁻⁶	0.999992	1.2566×10 ⁻⁶
Iron (pure)		5000	6.3×10 ⁻³
Superconductors	-1	0	0

$$\vec{B} = \mu_0 (1 + \chi_m) \vec{H}$$

$$\vec{B} = \mu_0 (1 + \chi_m) \vec{H}$$

$$B = \mu_0 \mu_r H = \mu H$$

$$\mu_r = 1 + \chi_m$$

relative permeability

Maxwell equation in matter

$$\vec{\nabla} \cdot \vec{D} = \rho_f$$
$$\vec{\nabla} \cdot \vec{B} = 0$$

$$\vec{D} = \epsilon \vec{E}$$

$$\epsilon = \epsilon_0 \epsilon_r$$

 μ

$$\vec{\nabla} \times \vec{E} = -\frac{\partial B}{\partial t} \qquad \vec{H} = \frac{1}{\mu} \vec{B}$$
$$\vec{\nabla} \times \vec{H} = \vec{j}_f + \frac{\partial \vec{D}}{\partial t} \qquad \mu = \mu_0 \mu_r$$
$$\vec{E} = \sigma \vec{j}$$

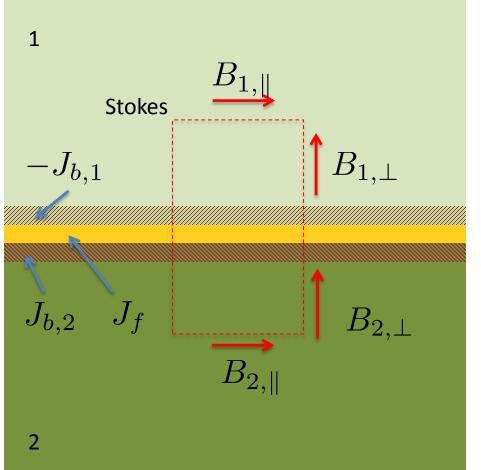

Summary of quantities

- $\vec{E} = \text{electric field}$
- $\vec{D} = \text{electric displacement}$
- \vec{H} = magnetic field
- \vec{B} = magnetic flux density
- $\vec{\rho} = \text{electric charge density}$
- $\vec{j} = \text{current density}$
- $\vec{E} = \text{electric displacement}$
- μ_0 = permeability of free space, $4\pi \times 10^{-7}$
- $\epsilon_0 = \text{permittivity of free space}, 8.854 \times 10^{-12}$
 - $c = \text{speed of light}, 2.99792458 \times 10^8$

Boundary conditions

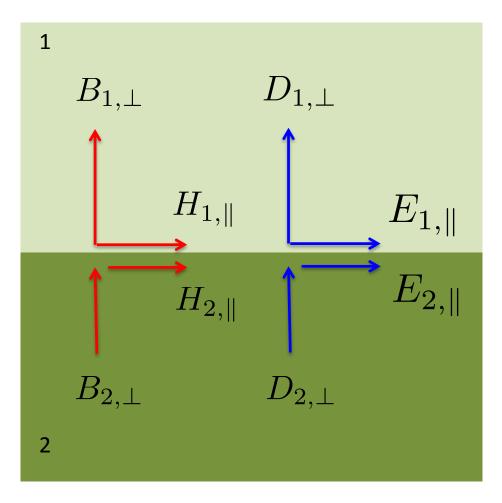

Boundary conditions

$$B_{1,\perp} = B_{2,\perp}$$
$$B_{1,\parallel} - B_{2,\parallel} = \mu_0(-J_{b,1} + J_f + J_{b,2})$$
$$B_{1,\parallel} - B_{2,\parallel} = \mu_0(-M_{1,\parallel} + j_f + M_{2,\parallel})$$

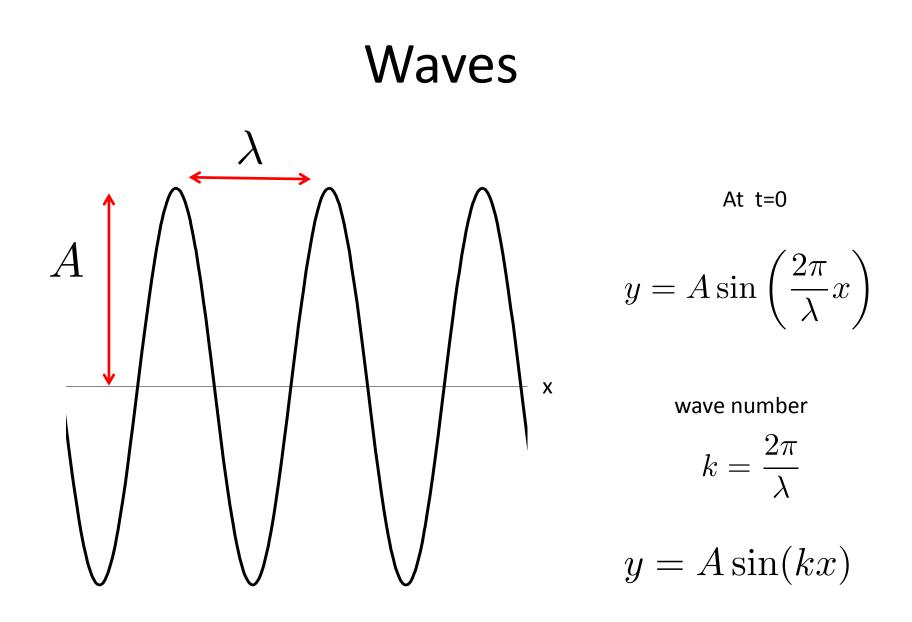

$$H_{1,\parallel} - H_{2,\parallel} = j_f$$

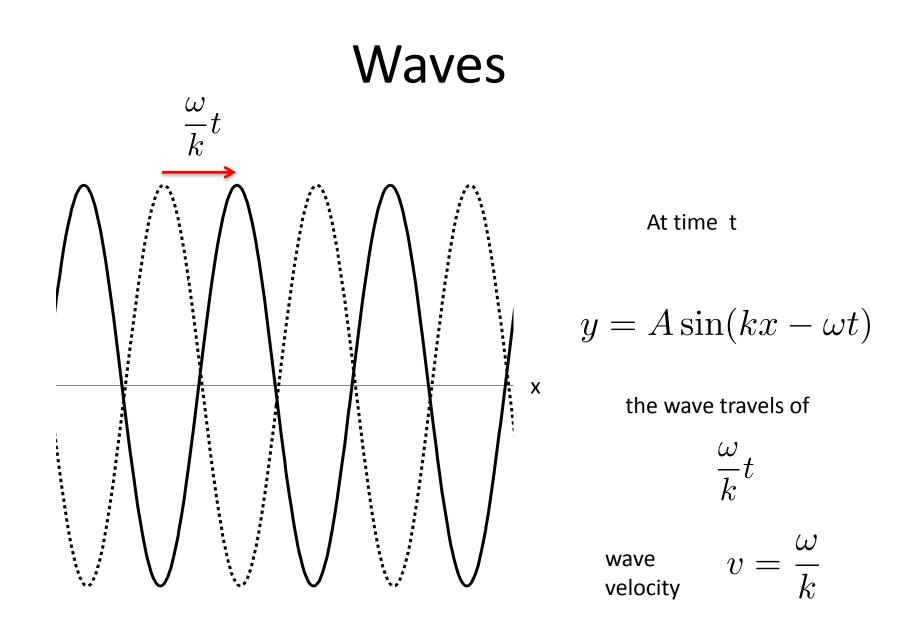

Summary boundary conditions

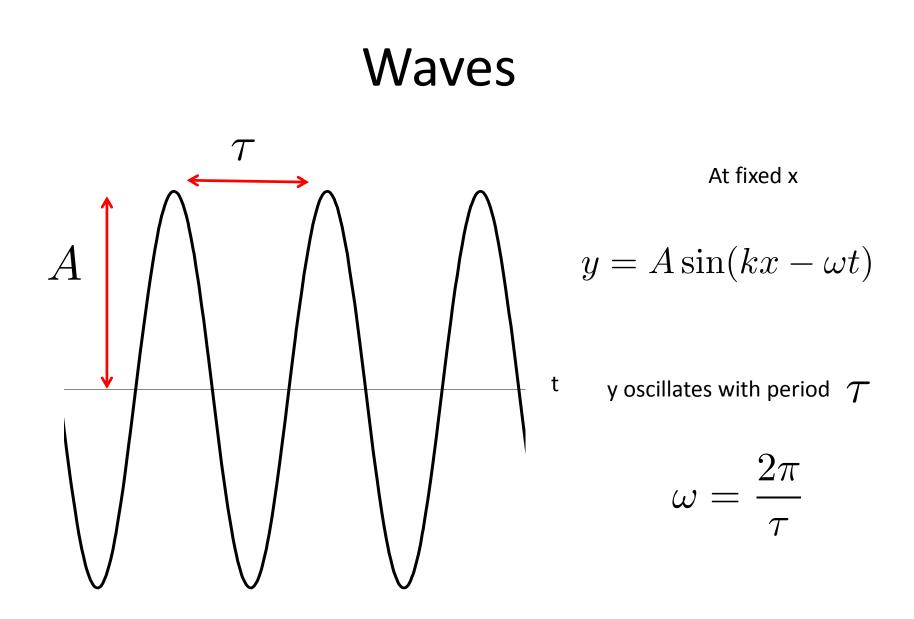

$$E_{1,\parallel} = E_{2,\parallel}$$

 $D_{1,\perp} - D_{2,\perp} = \sigma$
 $H_{1,\parallel} - H_{2,\parallel} = j_f$
 $B_{1,\perp} = B_{2,\perp}$

Wave equation

$$\begin{split} \frac{\partial^2}{\partial t^2} f &= v^2 \nabla^2 f \qquad f = A \sin(\vec{k} \cdot \vec{x} - \omega t) \\ v^2 (k_x^2 + k_y^2 + k_z^2) &= \omega^2 \end{split} \\ \end{split}$$
The vector $\frac{\vec{k}}{|\vec{k}|}$ gives the direction of propagation of the wave
the velocity of propagation is $v = \frac{\omega}{|\vec{k}|}$

Electromagnetic waves

Maxwell equations in vacuum

 $\frac{\partial^2}{\partial t^2}\vec{E} = \frac{1}{\epsilon_0\mu_0}\nabla^2\vec{E}$ $\vec{\nabla} \cdot \vec{E} = 0$ $\nabla \cdot \vec{B} = 0$ $\frac{\partial^2}{\partial t^2}\vec{B} = \frac{1}{\epsilon_0\mu_0}\nabla^2\vec{B}$ $\vec{\nabla} \times \vec{E} = -\frac{\partial \vec{B}}{\partial t}$ $v = \frac{1}{\sqrt{\epsilon_0 \mu_0}} = c$ $\vec{\nabla} \times \vec{B} = \mu_0 \epsilon_0 \frac{\partial}{\partial t} \vec{E}$ speed of light !!

Planar waves

Starting ansatz
$$\vec{E} = \vec{E}_0 f(\vec{k}\cdot\vec{x}-\omega t)$$

From 1st equation

$$\vec{\nabla} \cdot \vec{E} = \vec{k} \cdot \vec{E}_0 f'(\vec{k} \cdot \vec{x} - \omega t) = 0$$
$$\vec{k} \cdot \vec{E}_0 = 0$$

The electric field is orthogonal to the direction of wave propagation

From 3rd equation

$$\vec{\nabla} \times \vec{E} = \vec{k} \times \vec{E}_0 f'(\vec{k} \cdot \vec{x} - \omega t) = -\frac{\partial}{\partial t} \vec{B}$$

Integrating over time

$$\vec{B} = \frac{\vec{k}}{\omega} \times \vec{E}_0 f(\vec{k} \cdot \vec{x} - \omega t)$$

This satisfy the 2nd equation, in fact

$$\vec{\nabla} \cdot \vec{B} = \vec{k} \cdot \frac{\vec{k}}{\omega} \times \vec{E}_0 f'(\vec{k} \cdot \vec{x} - \omega t) = 0$$

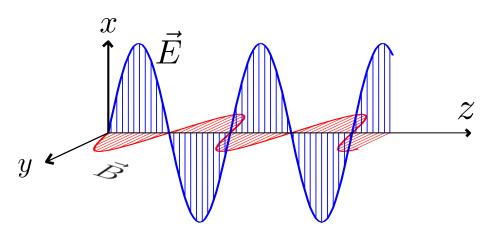

$$\vec{\nabla} \times \vec{B} = \vec{k} \times \left[\frac{\vec{k}}{\omega} \times \vec{E}_0 f'(\vec{k} \cdot \vec{x} - \omega t) \right]$$
$$\vec{\nabla} \times \vec{B} = \left(\vec{k} \cdot \vec{E}_0 \vec{k} - k^2 \vec{E}_0 \right) \left[\frac{1}{\omega} f'(\vec{k} \cdot \vec{x} - \omega t) \right]$$
$$\vec{\nabla} \times \vec{B} = -k^2 \vec{E}_0 \left[\frac{1}{\omega} f'(\vec{k} \cdot \vec{x} - \omega t) \right]$$
$$\vec{\nabla} \times \vec{B} = -\frac{k^2}{\omega^2} \vec{E}_0 \omega f'(\vec{k} \cdot \vec{x} - \omega t)$$
$$\vec{\nabla} \times \vec{B} = \frac{1}{c^2} \left[-\omega \vec{E}_0 f'(\vec{k} \cdot \vec{x} - \omega t) \right] = \mu_0 \epsilon_0 \frac{\partial}{\partial t} \vec{E}$$

Planar wave solution

$$\vec{E} = \vec{E}_0 f(\vec{k} \cdot \vec{x} - \omega t)$$
$$\vec{B} = \vec{B}_0 f(\vec{k} \cdot \vec{x} - \omega t)$$

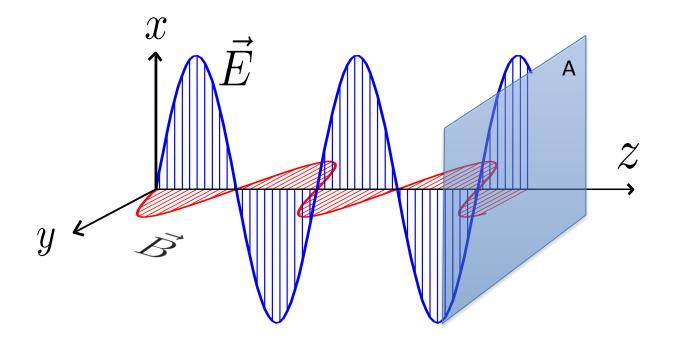

$$\vec{B}_0 = \frac{1}{c}\hat{k} \times \vec{E}_0 \qquad \omega/k = c$$

Sinusoidal example

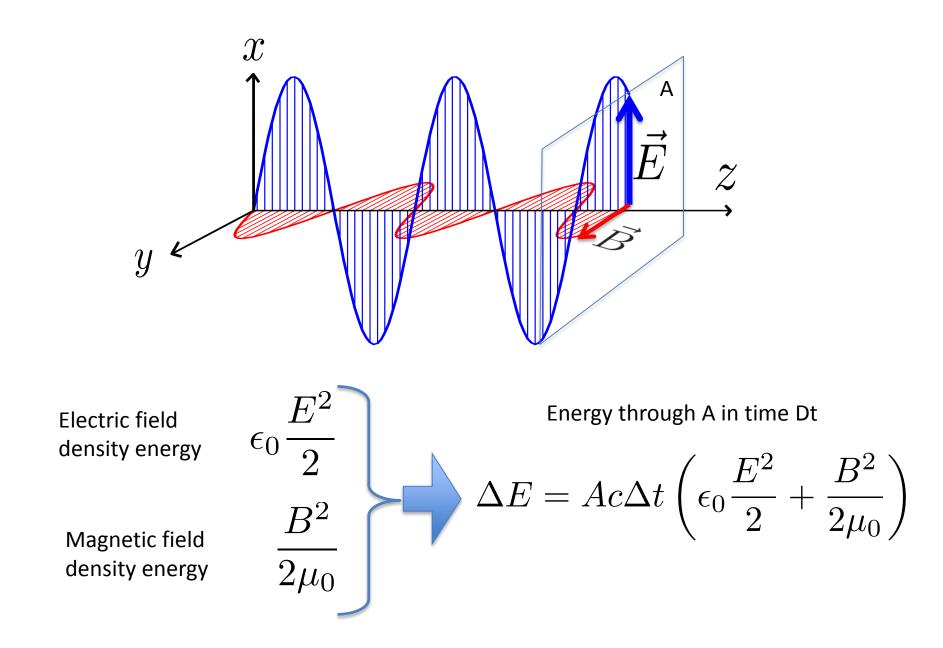

$$\vec{E} = \hat{x}E_0\sin(\vec{k}\cdot\vec{x}-\omega t)$$
$$\vec{B} = \hat{y}B_0\sin(\vec{k}\cdot\vec{x}-\omega t)$$
with $\vec{k} = \hat{z}\frac{\omega}{c}$ $B_0 = \frac{E_0}{c}$

Poynting vector

What is the flux of energy going through the surface A?

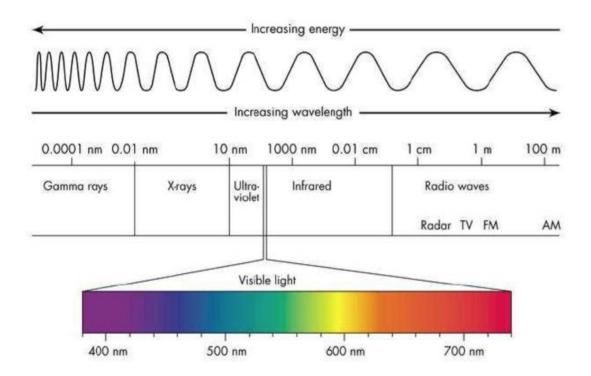

Energy flux: Poynting vector

Energy flux
$$S = \frac{\Delta E}{A\Delta t} = c \left(\epsilon_0 \frac{E^2}{2} + \frac{B^2}{2\mu_0}\right)$$

But for EM wave $\Rightarrow B = E/c$
$$\frac{B^2}{2\mu_0} = \frac{E^2}{2\mu_0 c^2} = \epsilon_0 \frac{E^2}{2}$$

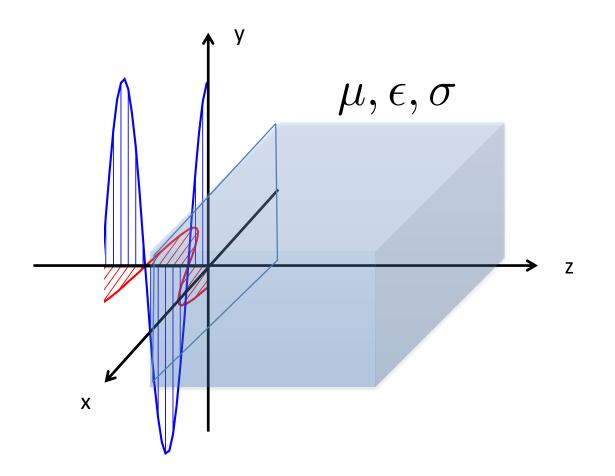

Poynting vector
$$S = \epsilon_0 E^2 c = \epsilon_0 E B c^2$$
$$\vec{S} = \frac{\vec{E} \times \vec{B}}{\mu_0}$$

Spectrum of Electromagnetic waves

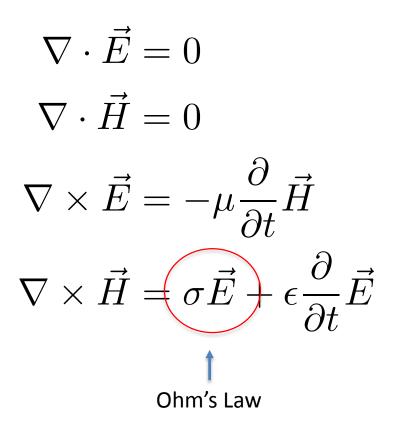

Example: yellow light $\rightarrow \approx 5 \cdot 10^{14}$ Hz (i.e. $\approx 2 \text{ eV }!$) gamma rays $\rightarrow \leq 3 \cdot 10^{21}$ Hz (i.e. $\leq 12 \text{ MeV }!$) LEP (SR) $\rightarrow \leq 2 \cdot 10^{20}$ Hz (i.e. $\approx 0.8 \text{ MeV }!$)

Interaction with conductors

EM wave in a conducting media

$$\nabla^2 \vec{E} = \mu \sigma \frac{\partial}{\partial t} \vec{E} + \mu \epsilon \frac{\partial^2}{\partial t^2} \vec{E}$$

Similar relation is found for H

Starting ansatz
$$\vec{E} = \hat{x}E_0f(z)\sin(kz - \omega t)$$

 $\vec{E} = \hat{x}E_0e^{-\alpha z}\sin(kz - \omega t)$
 $\alpha = \omega\sqrt{\frac{\mu\epsilon}{2}}\sqrt{-1 + \sqrt{1 + (\frac{\sigma}{\epsilon\omega})^2}}$
 $k = \omega\sqrt{\frac{\mu\epsilon}{2}}\sqrt{1 + \sqrt{1 + (\frac{\sigma}{\epsilon\omega})^2}}$

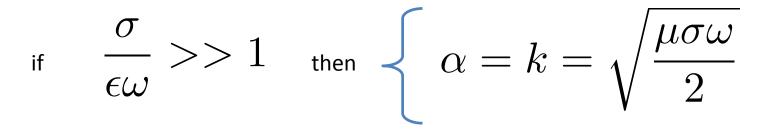

Wave propagation

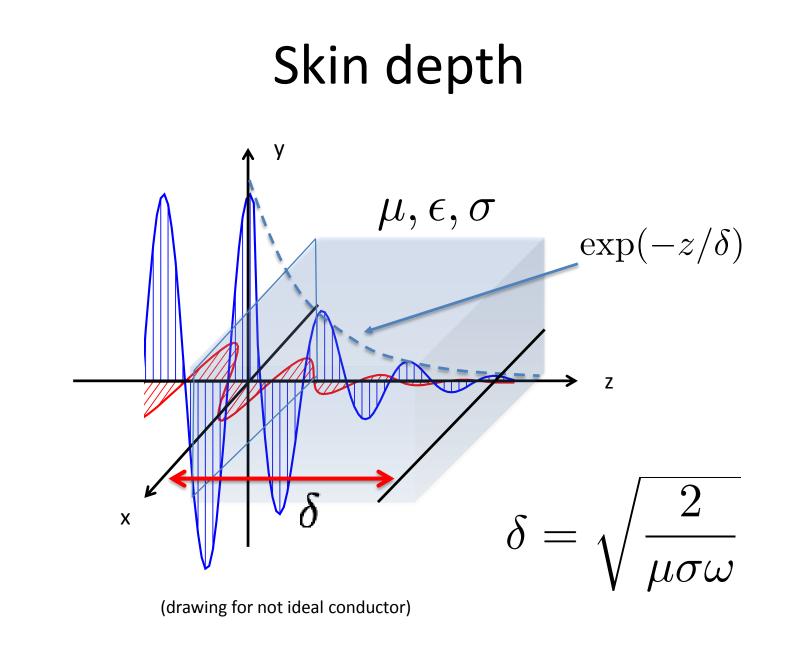

It depends on $\ \ \mu,\epsilon,\sigma$

Bad conductor

If $\sigma \to 0$ then $\left\{ \begin{array}{l} \alpha \to 0 \ \ {\rm wave\ is\ un-damped} \\ k \to \omega \sqrt{\mu \epsilon} \end{array} \right.$

Good conductor

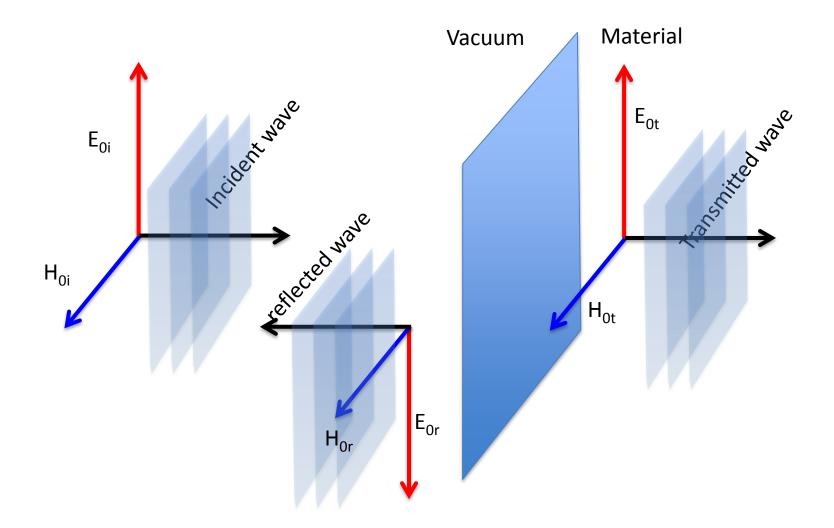

consider copper which has an electrical conductivity $\sigma=5.8\times10^7\,S/m~~\mu\simeq\mu_0$, and $\,\varepsilon\simeq\varepsilon_0$

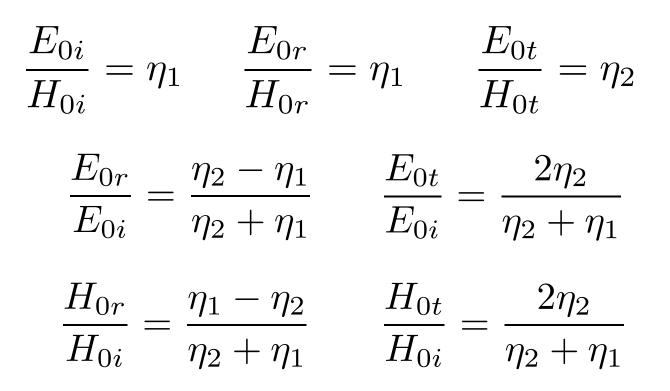

f	δ	
60 Hz	8530 μm	
1 MHz	66.1 μm	
10 MHz	20.9 µm	
100 MHz	6.6 µm	
1 GHz	2.09 μm	

Transmission, Reflection

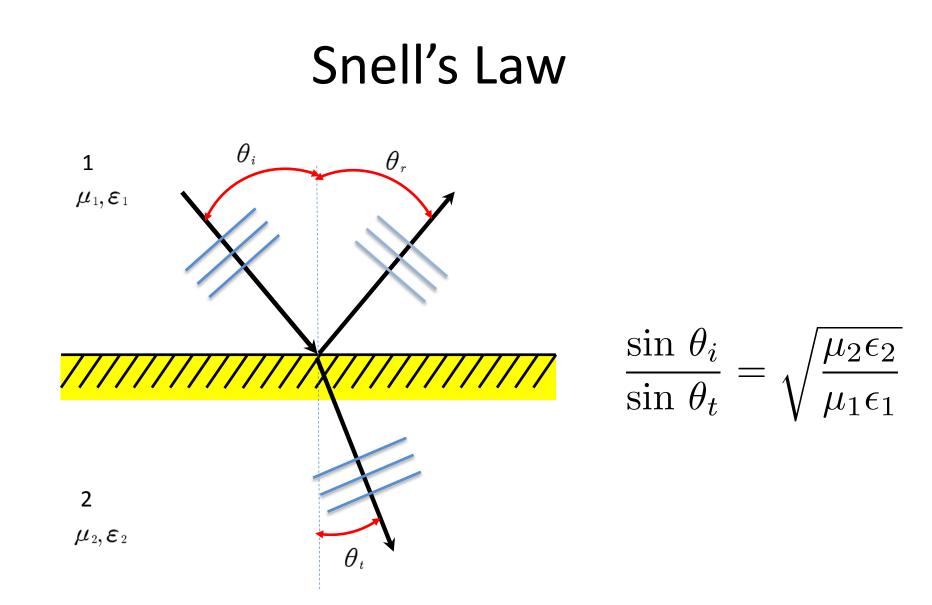

At the interface between the two region the boundary condition are

$$E_{0i} + E_{0r} = E_{0t}
 H_{0i} + H_{0r} = H_{0t}$$

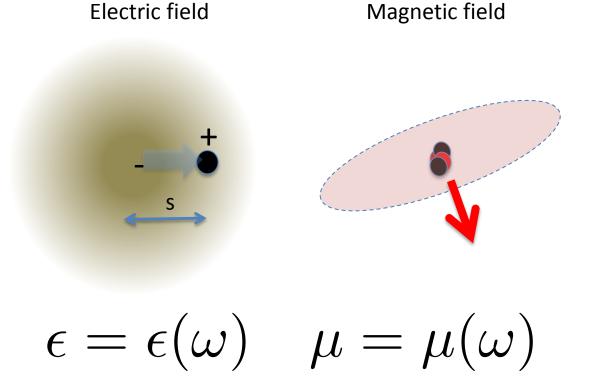

$$\begin{array}{ccc} & \operatorname{Perfect\ conductor} & \sigma = \infty & \eta = \sqrt{\frac{\omega\mu}{\sigma}} \to 0 \\ \\ & \operatorname{Perfect\ dielectric} & \sigma = 0 & \eta = \sqrt{\frac{\mu}{\epsilon}} \\ \\ & & \operatorname{Perfect\ dielectric} & \operatorname{Perfect\ conductor} \\ & & \\$$

EM in dispersive matter

Response to "external" electromagnetic field needs "time"

Wave velocity depends on

$$v = \frac{1}{\sqrt{\epsilon(\omega)\mu(\omega)}}$$

The relation for k and $\,\omega\,$

$$v^2(k_x^2 + k_y^2 + k_z^2) = \omega^2$$

becomes more complicated because v depends on omega

Waves at different frequencies travels with different velocity \rightarrow they "spread"

$$\omega = \omega(k)$$

Usually a pulse of electromagnetic wave is composed by several waves of different frequency - \rightarrow

Phase velocity and group velocity

A general wave can be decomposed in sum of harmonics

$$f(\vec{x},t) = \int A(\vec{k}) e^{i[\vec{k}\cdot\vec{x}-\omega(\vec{k})t]} dk^3$$

If $\,\omega\,$ is independent from $\,ec{k}\,$ the wave does not get "dispersed"

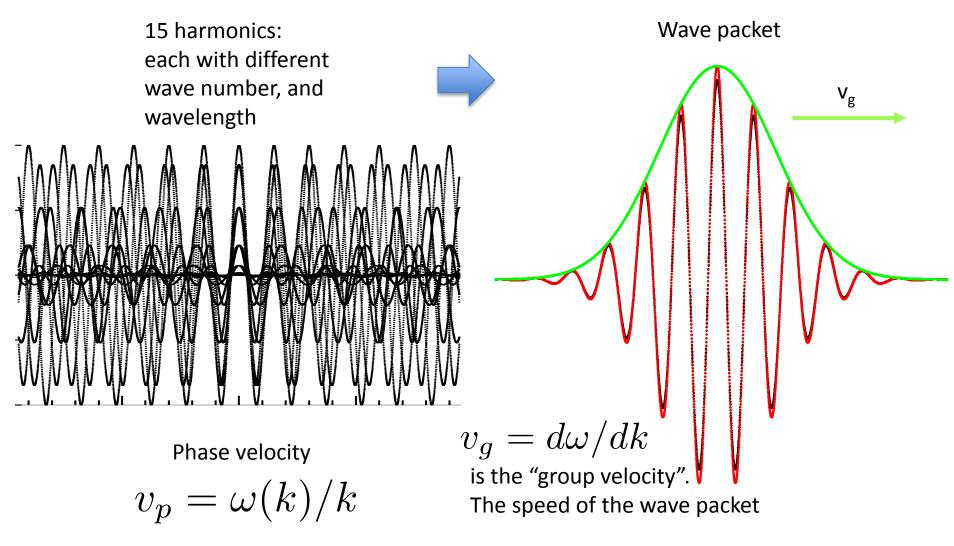

If A(k) is peaked around ${f k_{\scriptscriptstyle 0}}$ then $\,\,oldsymbol{\omega}\,\,$ can be expanded around $\,k_{\scriptscriptstyle 0}$

$$\omega(k) = \omega_0 + \omega'(k - k_0)$$

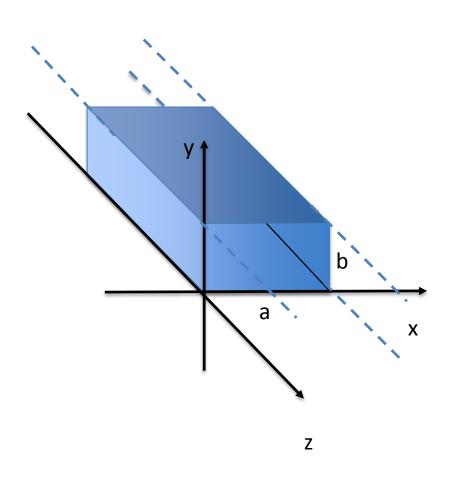

$$f(x,t) = \int A(k)e^{i[kx-\omega_0 t - \omega'(k-k_0)]}dk$$

$$f(x,t) = e^{i[k_0 x - \omega_0 t]} \int A(k)e^{i(k-k_0)(x-\omega't)}dk$$
Fast wave
Slow wave modulating the fast wave
Speed $\Rightarrow v_g = \frac{\partial \omega}{\partial k}|_{k_0}$

Example

Waveguides

Walls: Perfect conductor $\,\sigma=\,$

Inside the guide: Perfect dielectric $\sigma = 0$

 (\mathbf{X})

Boundary condition at the walls

$E_{x}(0,x,z)=0$	E _y (0,y,z)=0
$E_x(x,a,z) = 0$	E _y (b,y,z)=0

In the perfect dielectric

Maxwell equations

$$\vec{\nabla} \cdot \vec{E} = 0$$
$$\vec{\nabla} \cdot \vec{H} = 0$$
$$\vec{\nabla} \times \vec{E} = -\mu \frac{\partial \vec{H}}{\partial t}$$
$$\vec{\nabla} \times \vec{H} = \epsilon \frac{\partial \vec{E}}{\partial t}$$

Dispersion relation

$$k_c^2 = \omega^2 \epsilon \mu - k^2$$

Working ansatz

$$\vec{E} = \vec{E}_0(x, y)e^{i(kz - \omega t)}$$
$$\vec{H} = \vec{H}_0(x, y)e^{i(kz - \omega t)}$$

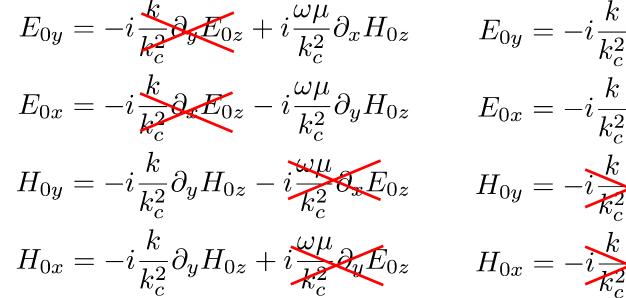

$$E_{0y} = -i\frac{k}{k_c^2}\partial_y E_{0z} + i\frac{\omega\mu}{k_c^2}\partial_x H_{0z}$$
$$E_{0x} = -i\frac{k}{k_c^2}\partial_x E_{0z} - i\frac{\omega\mu}{k_c^2}\partial_y H_{0z}$$
$$H_{0y} = -i\frac{k}{k_c^2}\partial_y H_{0z} - i\frac{\omega\mu}{k_c^2}\partial_x E_{0z}$$
$$H_{0x} = -i\frac{k}{k_c^2}\partial_y H_{0z} + i\frac{\omega\mu}{k_c^2}\partial_y E_{0z}$$

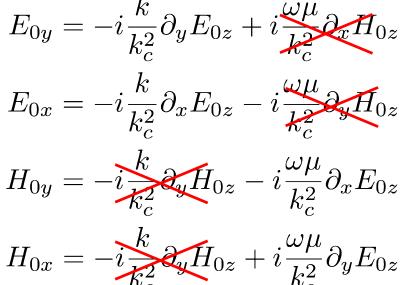

In the perfect dielectric

Only E_{0z} , and H_{0z} are in the partial derivatives: \rightarrow special solutions

Transverse electric wave TE $\leftarrow \rightarrow E_{0z} = 0$

TE waves

Equations

$$E_{0y} = i \frac{\omega \mu}{k_c^2} \partial_x H_{0z}$$
$$E_{0x} = -i \frac{\omega \mu}{k_c^2} \partial_y H_{0z}$$
$$H_{0y} = -i \frac{k}{k_c^2} \partial_y H_{0z}$$
$$H_{0x} = -i \frac{k}{k_c^2} \partial_y H_{0z}$$

These eqs. + $~ec{
abla}\cdotec{H}=0$

$$\partial_x^2 H_{0z} + \partial_y^2 H_{0z} = k_c^2 H_{0z}$$

Automatically $\ \vec{\nabla}\cdot\vec{E}=0$ Is satisfied

If you know H_{0z} , then you know everything

Boundary conditions: modes

$$\partial_x^2 H_{0z} + \partial_y^2 H_{0z} = k_c^2 H_{0z}$$

Search for the solution

$$H_{0z} = X(x)Y(y)$$

$$\frac{X''}{X} = -k_x^2$$
 $\frac{Y''}{Y} = -k_y^2$ \longrightarrow $k_c^2 = k_x^2 + k_y^2$

Boundary conditions

$$E_{x}(0,x,z) = 0$$

$$E_{x}(x,a,z) = 0$$

$$E_{y}(0,y,z) = 0$$

$$E_{y}(b,y,z) = 0$$

$$H_{0z,nm} = H_{nm} \cos\left(\frac{\pi n}{a}x\right) \cos\left(\frac{\pi m}{b}y\right)$$

Cut-off frequency

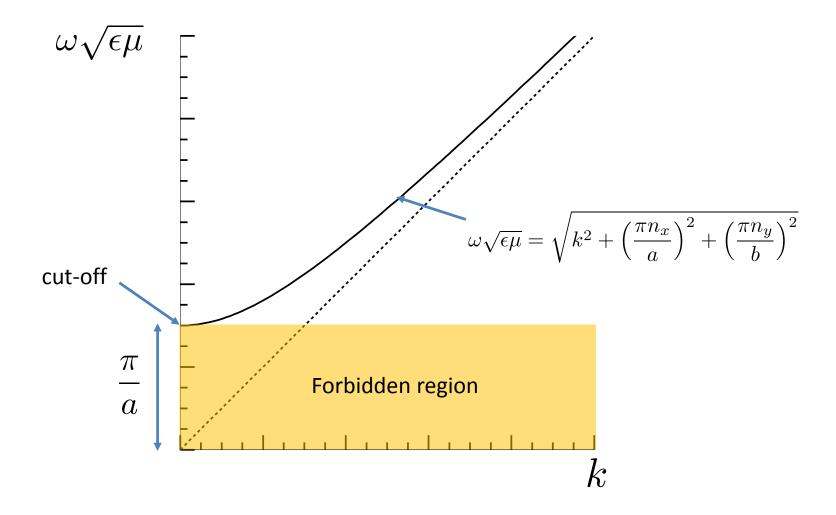

Dispersion
$$\omega^2 \epsilon \mu = k^2 + \left(\frac{\pi n_x}{a}\right)^2 + \left(\frac{\pi n_y}{b}\right)^2$$

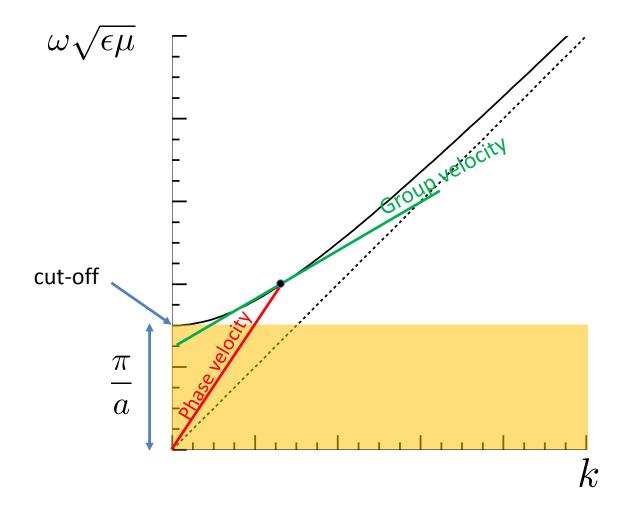

Only if k > 0 the wave can propagate without attenuation

Speed of
$$u = \frac{1}{\sqrt{\epsilon \mu}}$$
 $f > \frac{u}{2} \sqrt{\left(\frac{n_x}{a}\right)^2 + \left(\frac{n_y}{b}\right)^2}$ wave

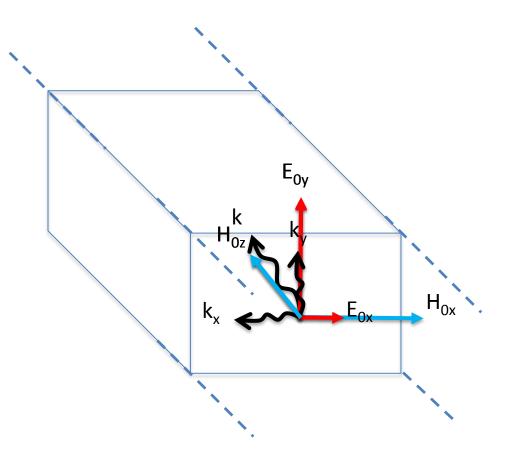

Cut-off frequency

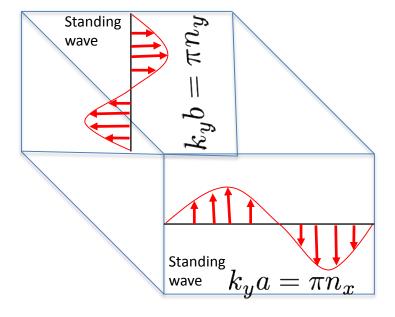

Given the fix frequency of a wave, only a certain number of modes can exists in the waveguide

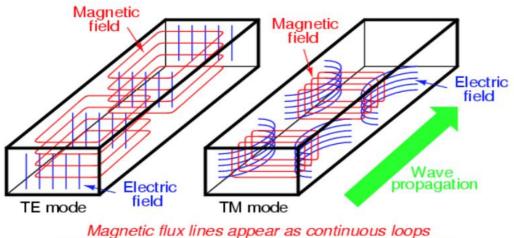

visually TE

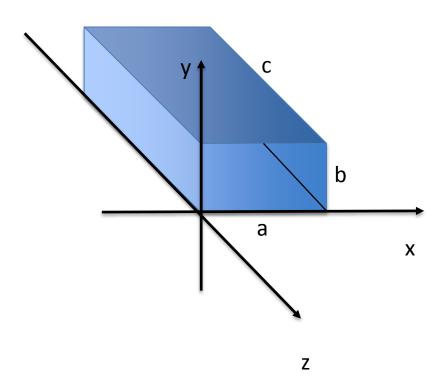

The fields in wave guides

Electric flux lines appear with beginning and end points

Electric and magnetic fields through a wave guide
 Shapes are consequences of boundary conditions !
 Can be Transverse Electric (TE, no E-field in z-direction) or Transverse Magnetic (TM, no B-field in z-direction)

Cavity

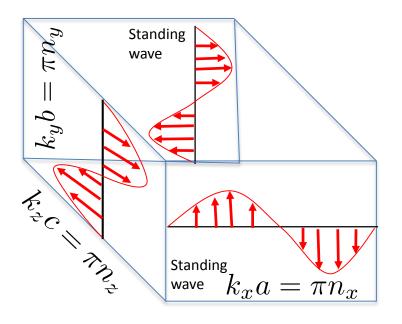

Walls: Perfect conductor $\,\sigma=\infty$

Inside the guide: Perfect dielectric $\sigma = 0$

Boundary condition at the walls

In every wall the tangent electric field Is zero

Cavity (rectangular)

Boundary condition

 $k_x a = \pi n_x$

 $k_y b = \pi n_y$

 $k_z c = \pi n_z$

Normal modes are only standing waves

Electromagnetic standing waves

$$E_x = E_{x0} \cdot \cos(k_x x) \cdot \sin(k_y y) \cdot \sin(k_z z) \cdot e^{-i\omega t}$$

$$E_y = E_{y0} \cdot \sin(k_x x) \cdot \cos(k_y y) \cdot \sin(k_z z) \cdot e^{-i\omega t}$$

$$E_z = E_{z0} \cdot \sin(k_x x) \cdot \sin(k_y y) \cdot \cos(k_z z) \cdot e^{-i\omega t}$$

$$B_x = \frac{i}{\omega} (E_{y0}k_z - E_{z0}k_y) \cdot \sin(k_x x) \cdot \cos(k_y y) \cdot \cos(k_z z) \cdot e^{-i\omega t}$$

$$B_y = \frac{i}{\omega} (E_{z0}k_x - E_{x0}k_z) \cdot \cos(k_x x) \cdot \sin(k_y y) \cdot \cos(k_z z) \cdot e^{-i\omega t}$$

$$B_z = \frac{i}{\omega} (E_{x0}k_y - E_{y0}k_x) \cdot \cos(k_x x) \cdot \cos(k_y y) \cdot \sin(k_z z) \cdot e^{-i\omega t}$$

Dispersion relation
$$\omega^2 = rac{1}{\epsilon\mu}(k_x^2+k_y^2+k_z^2)$$

G. Franchetti

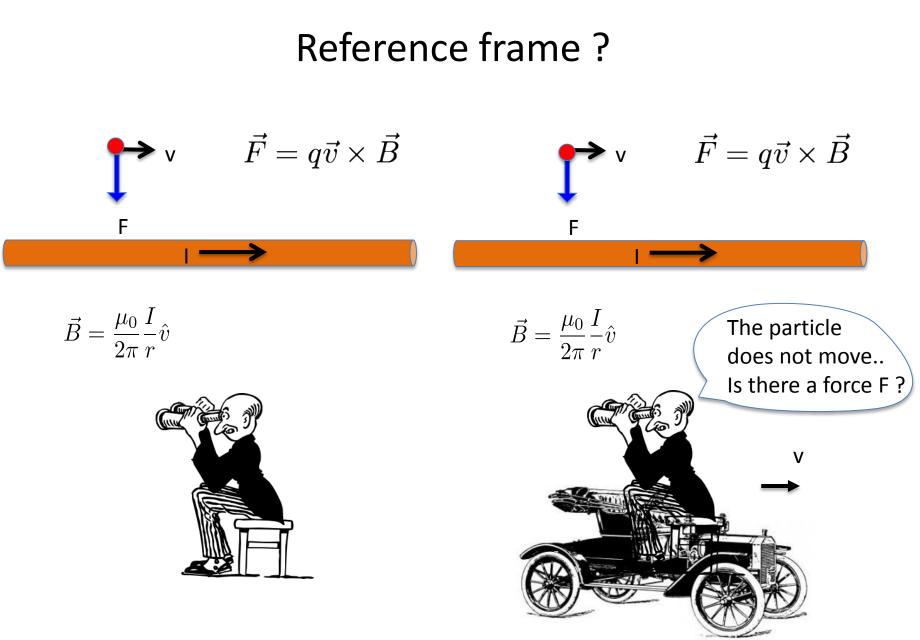

Final Observations

Potential vector was here presented for static field

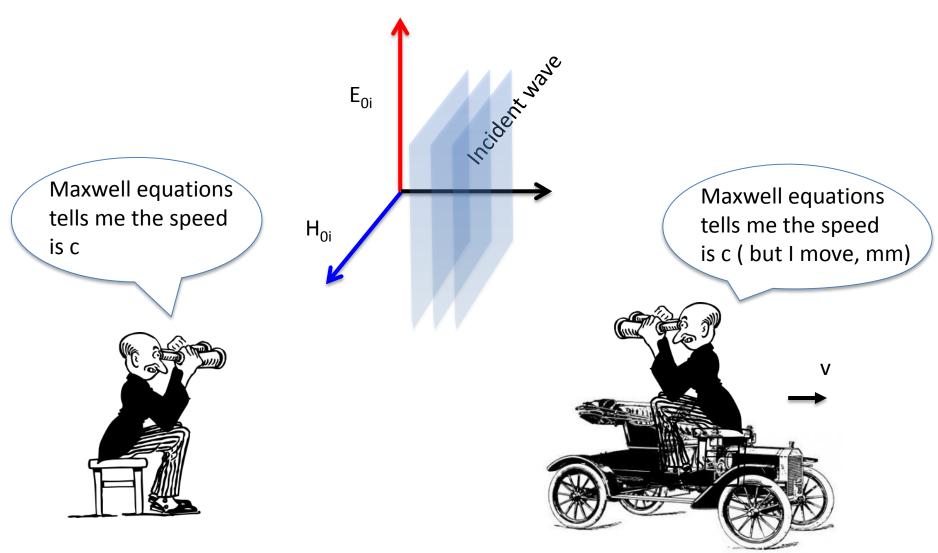

However one can also re-write the Maxwell equation in terms of the potential vector, and find electromagnetic wave of "A"

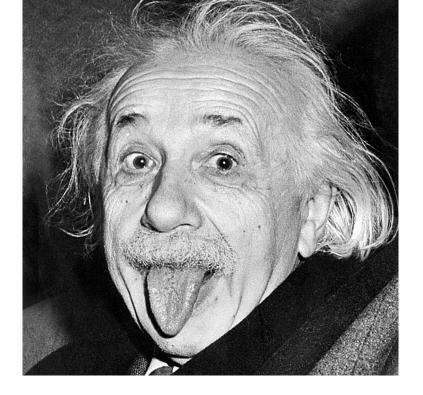

Internal degree of freedom: Gauges

Potential vector	$\vec{A} ightarrow \vec{A} + \vec{\nabla}C$	(A is defined not In unique way)
Electric potential	$V \rightarrow V + c$	(V is not unique)
