Exploitation of LHC and Future Circular Colliders

Frédéric Bordry

Basics of Accelerator Science and Technology at CERN – Chavannes 8th November 2013

Outline

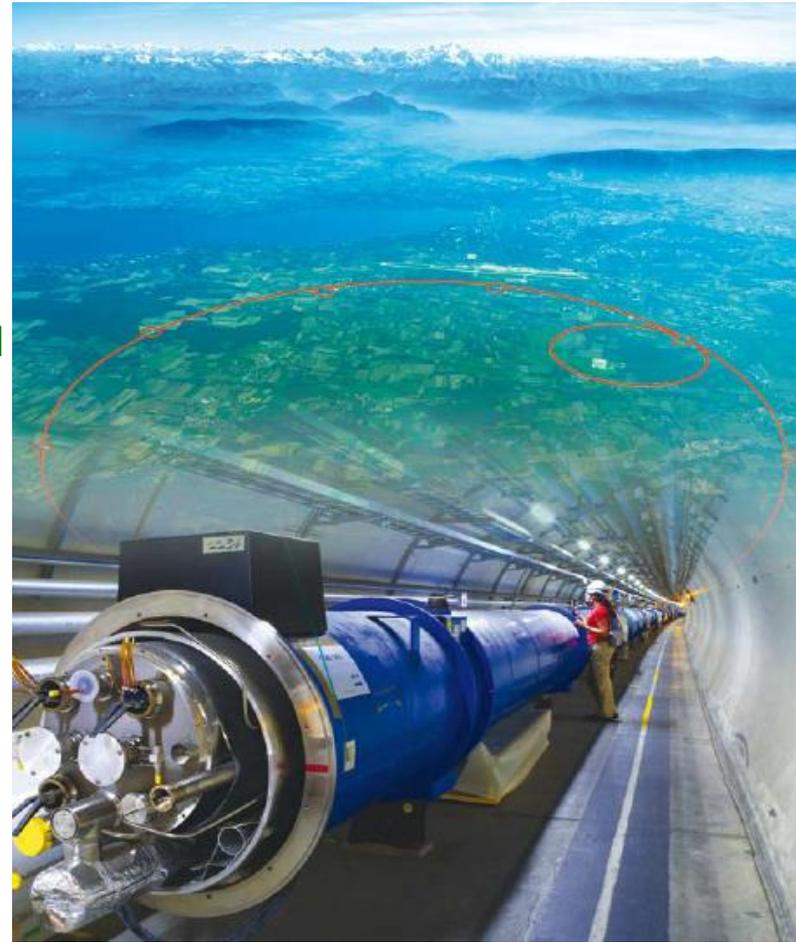

- LHC recall and 1st Run
- LS1 status
- Run 2 (from LS1 to LS2) \Rightarrow *13-14 TeV*
- LS2 and Run 3 \Rightarrow *300 fb⁻¹*
- High Luminosity LHC project \Rightarrow *3'000 fb⁻¹*
- Future Circular Colliders \Rightarrow *100 TeV*
- Conclusion

LHC (Large Hadron Collider)

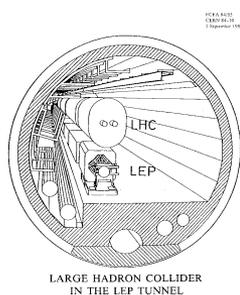

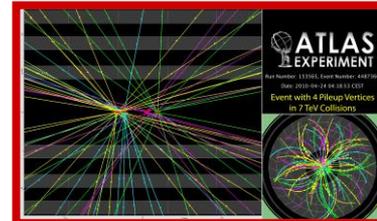

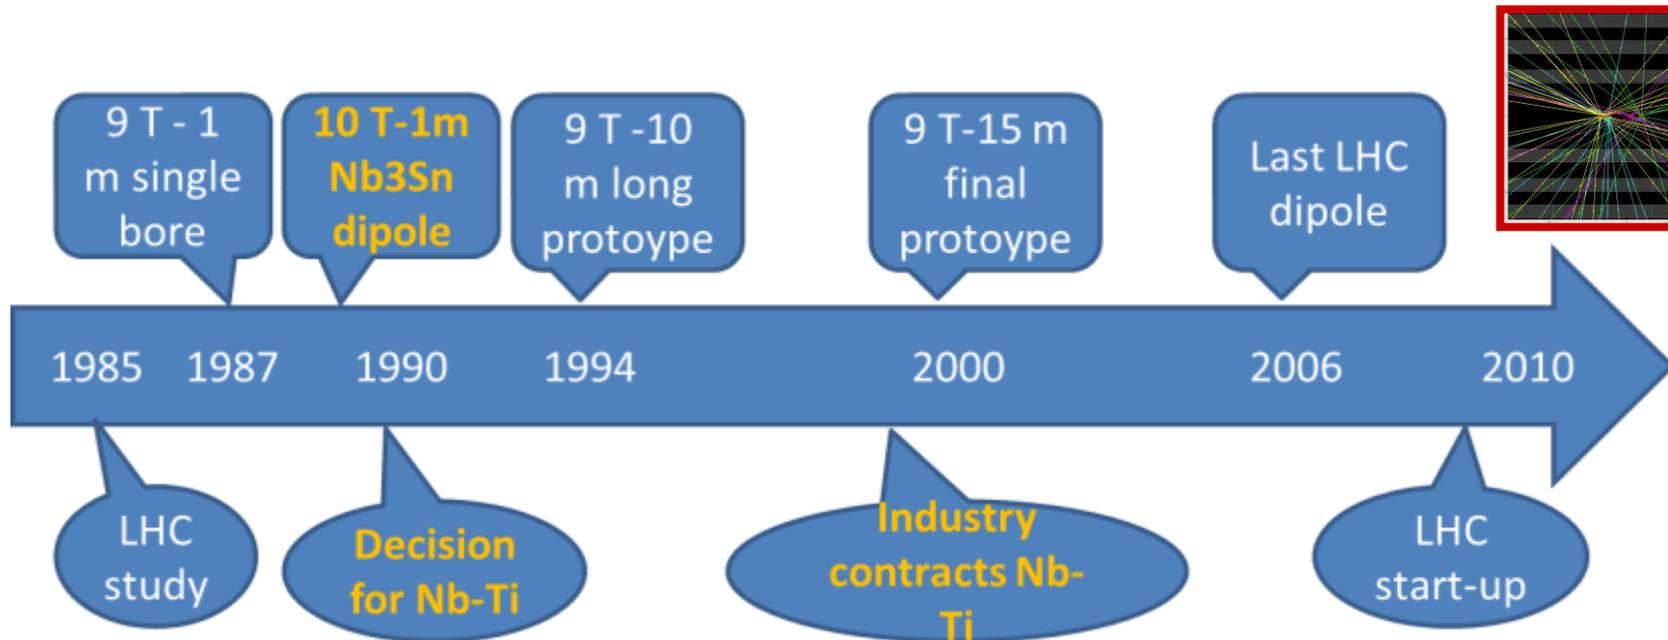

14 TeV proton-proton accelerator-collider built in the LEP tunnel

Lead-Lead (Lead-proton) collisions

- 1983 : First studies for the LHC project
- 1988 : First magnet model (feasibility)
- 1994 : Approval of the LHC by the CERN Council
- 1996-1999: Series production industrialisation
- 1998 : Declaration of Public Utility & Start of civil engineering
- 1998-2000: Placement of the main production contracts
- 2004 : Start of the LHC installation
- 2005-2007: Magnets Installation in the tunnel
- 2006-2008: Hardware commissioning
- 2008-2009: Beam commissioning and repair
- 2009-2030: Physics exploitation**

LHC, the construction timeline: Nb-Ti magnet maturation

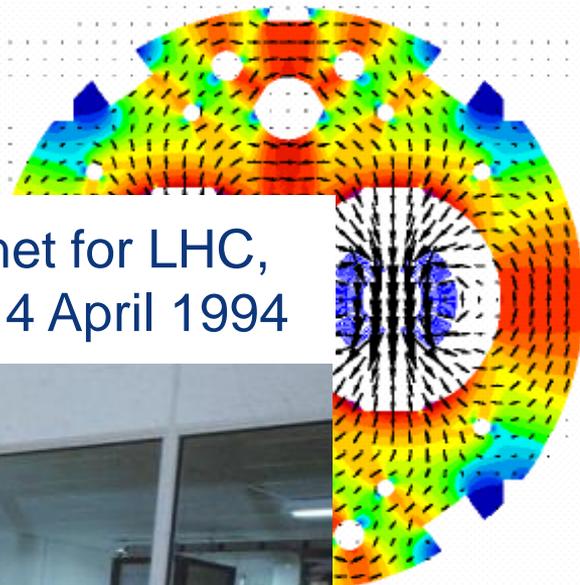

Prototype and industrialisation

Long Shutdown 1

LS1 starts as the shutdown to repair the magnet interconnects to allow nominal current in the dipole and lattice quadrupole circuits of the LHC.

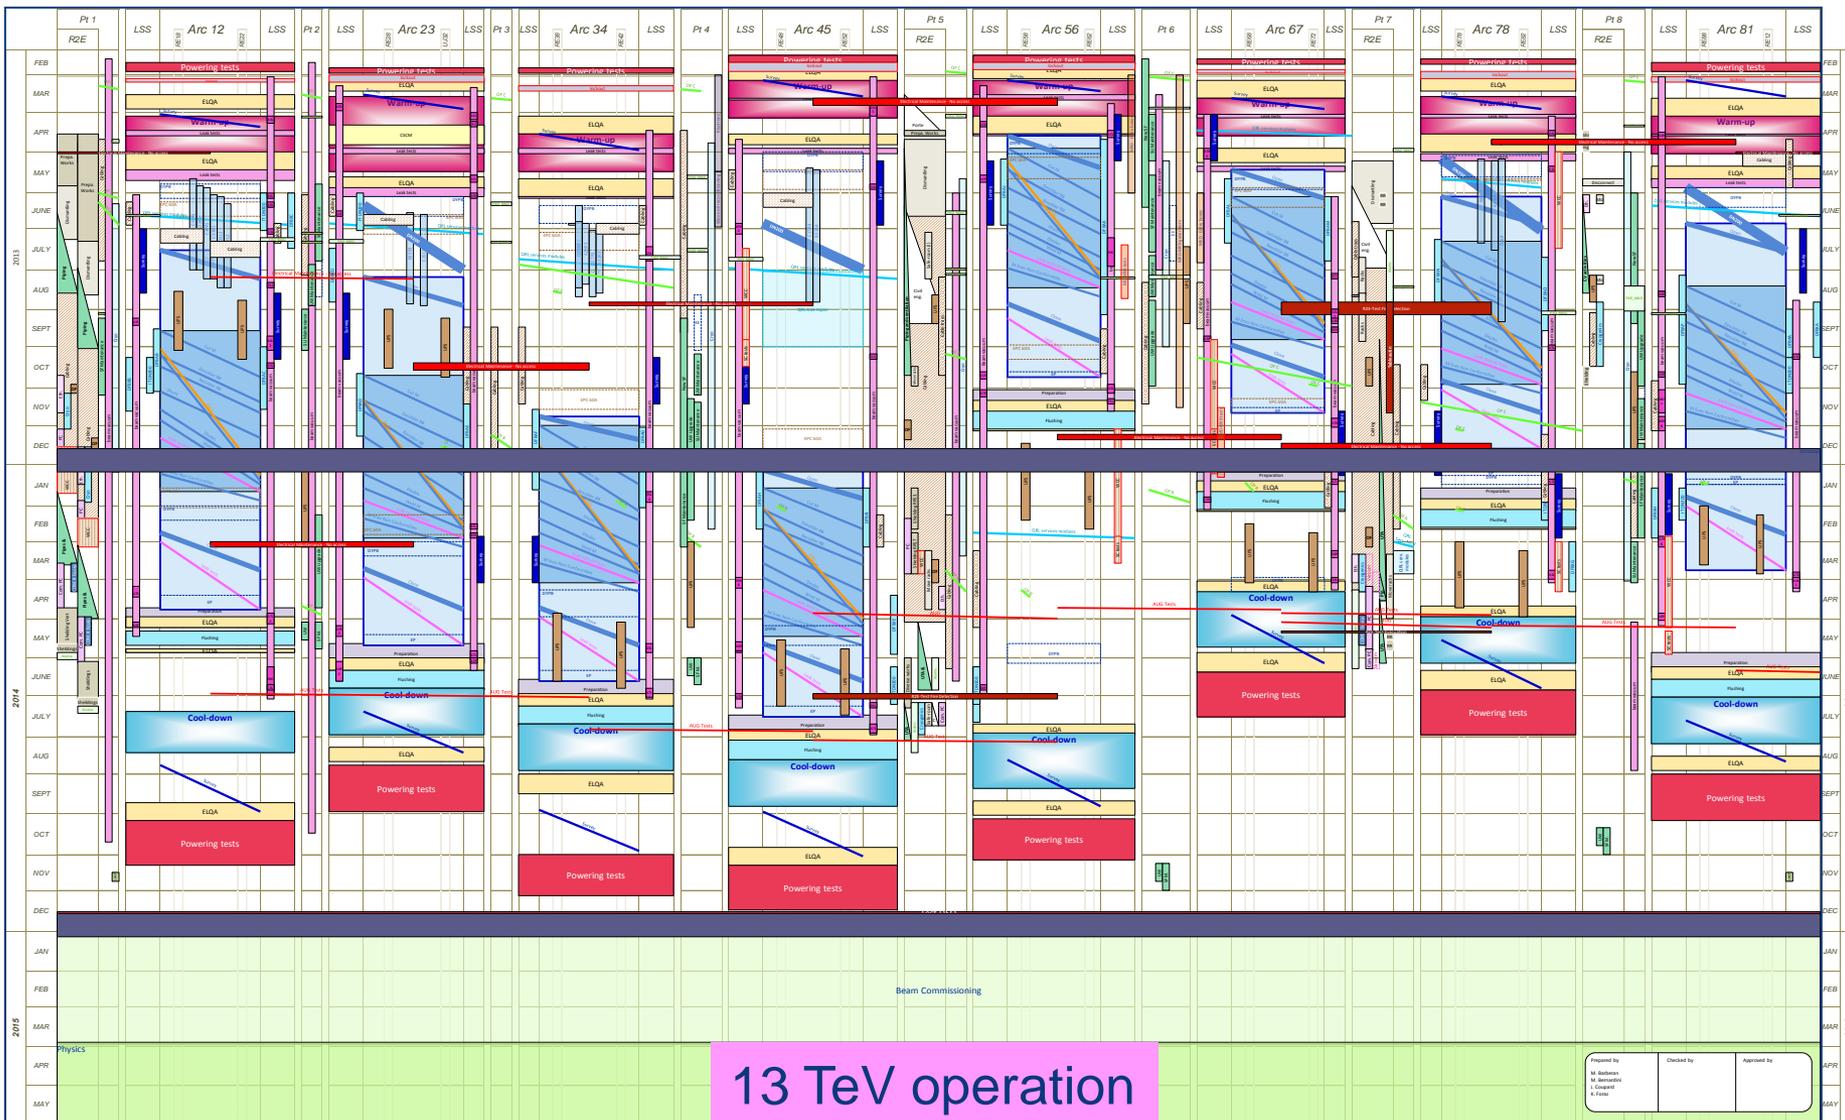

or shutdown which, in repairs, maintenance, and cabling across the and the associated

All this in the shadow interconnects.

LS1: LHC schedule

The main 2013-14 LHC consolidations

1695 Openings and final reclosures of the interconnections

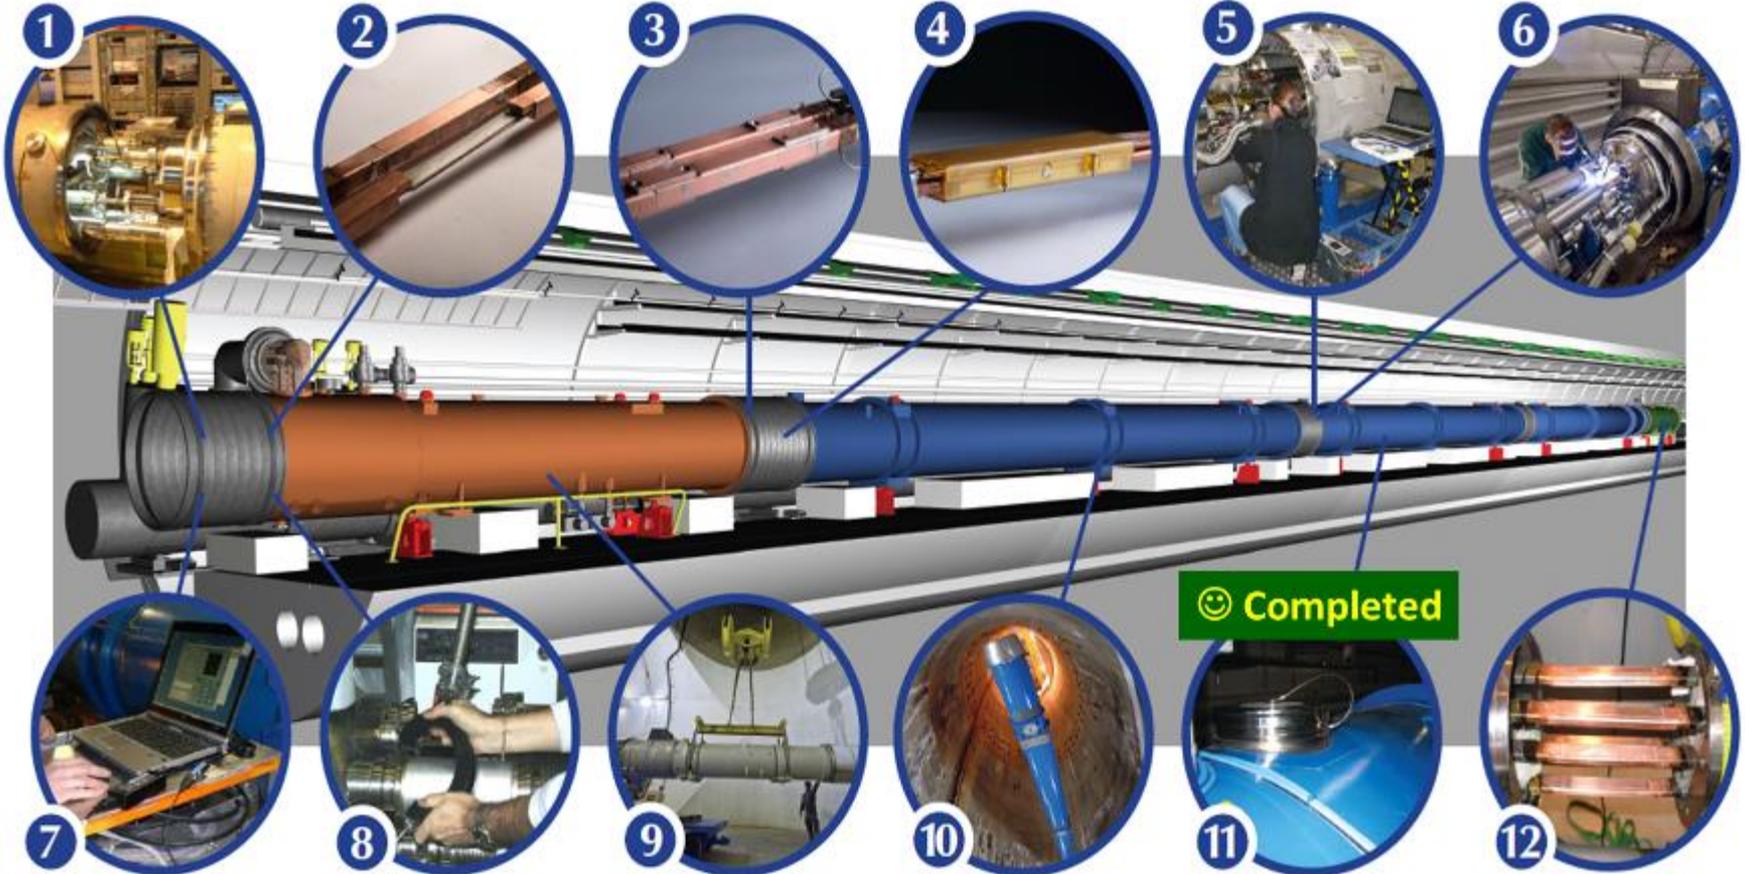

Complete reconstruction of 3000 of these splices

Consolidation of the 10170 13kA splices, installing 27 000 shunts

Installation of 5000 consolidated electrical insulation systems

300 000 electrical resistance measurements

10170 orbital welding of stainless steel lines

18 000 electrical Quality Assurance tests

10170 leak tightness tests

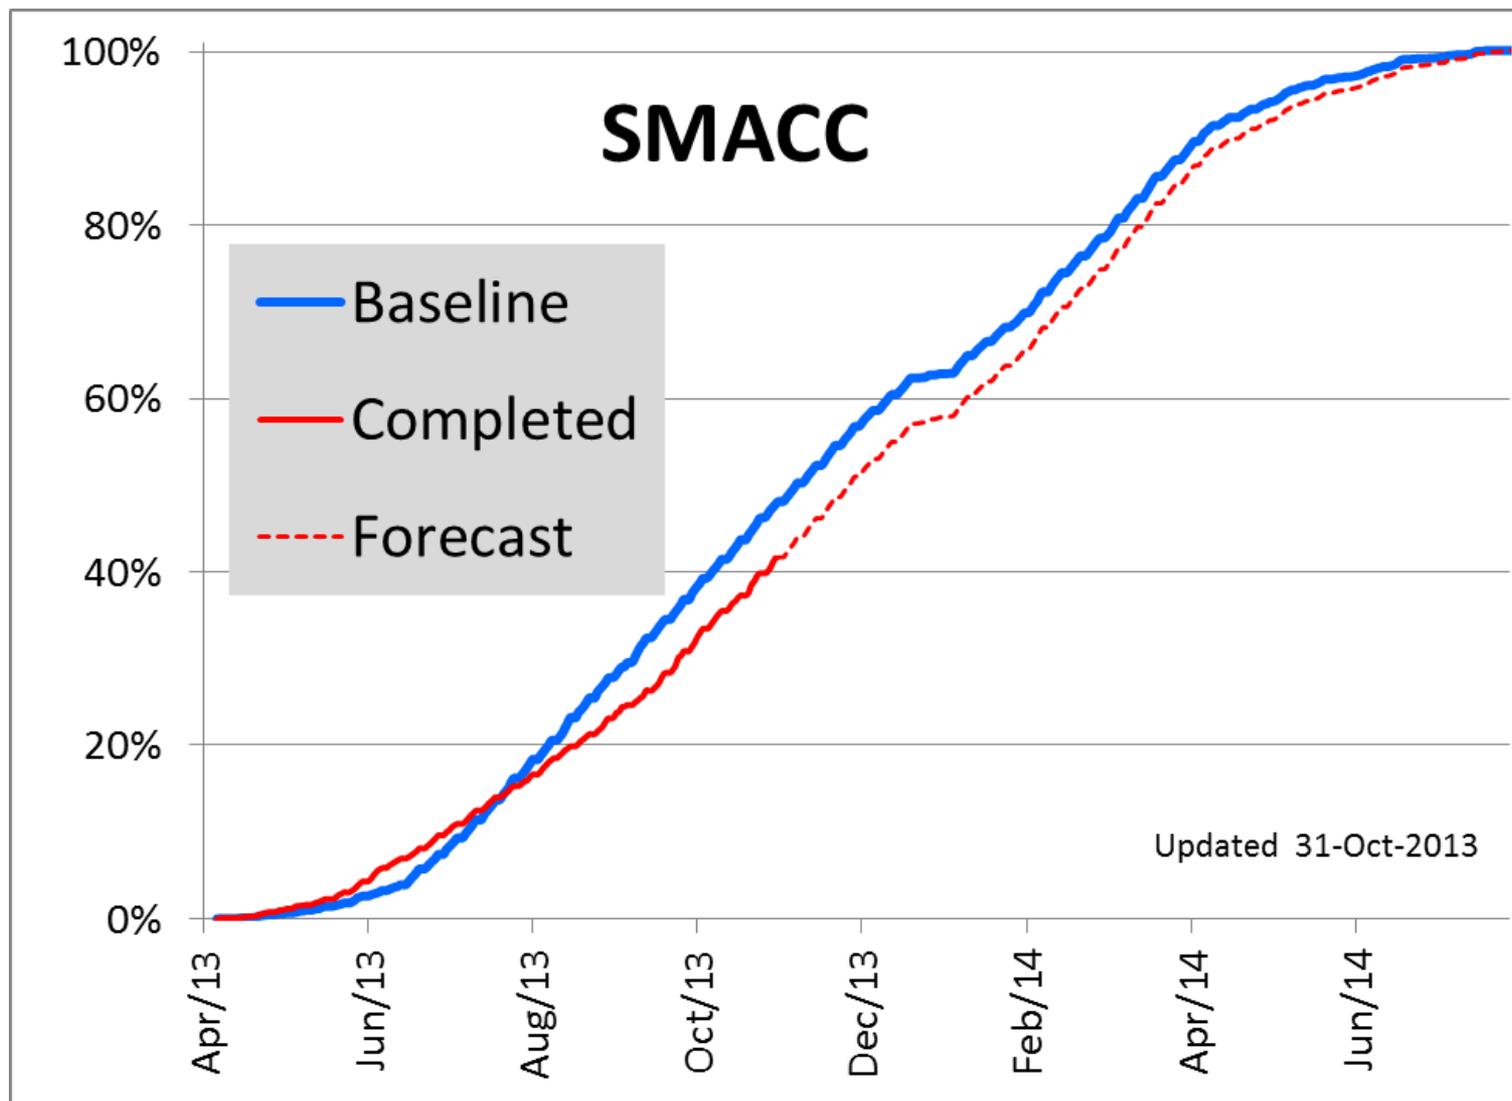

3 quadrupole magnets to be replaced

15 dipole magnets to be replaced

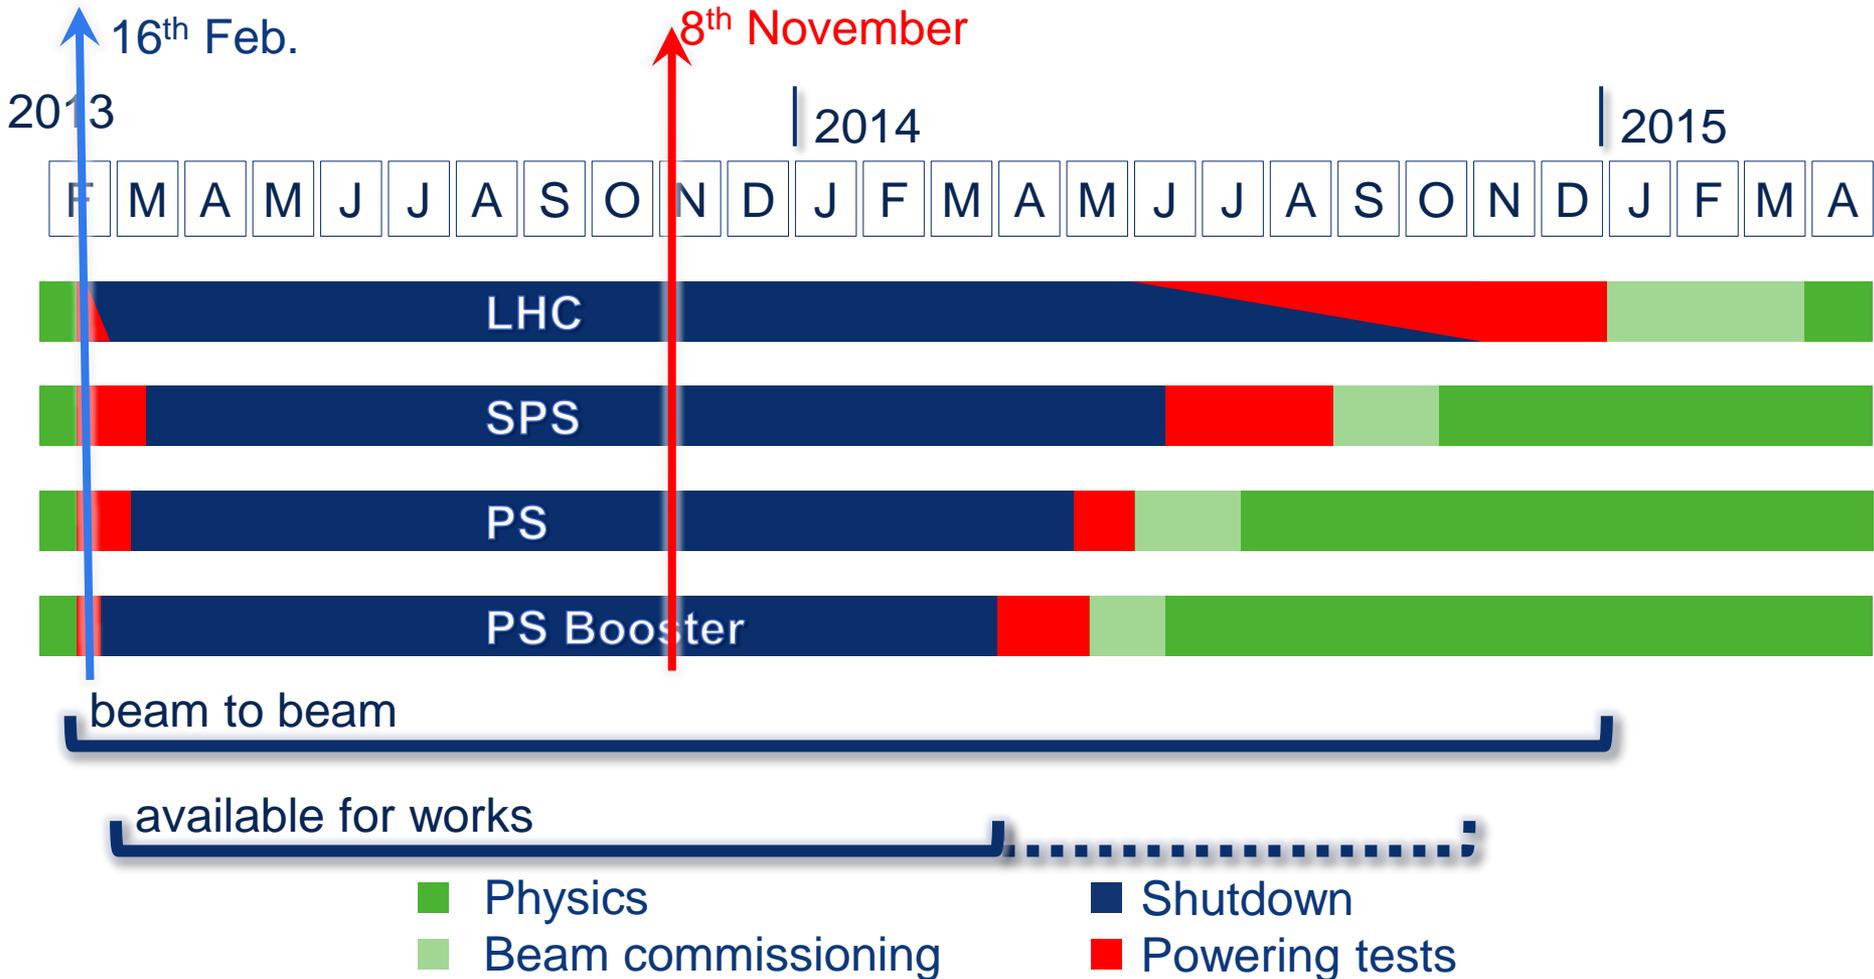

Installation of 612 pressure relief devices to bring the total to 1344

Consolidation of the 13 kA circuits in the 16 main electrical feed-boxes

SMACC Dashboards

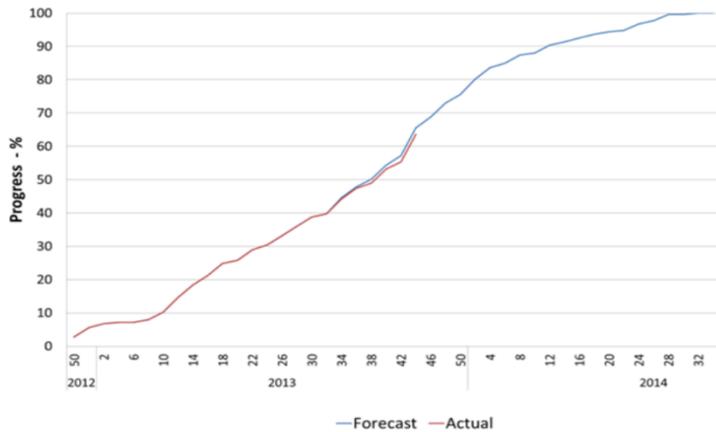

LS 1 from 16th Feb. 2013 to Dec. 2014

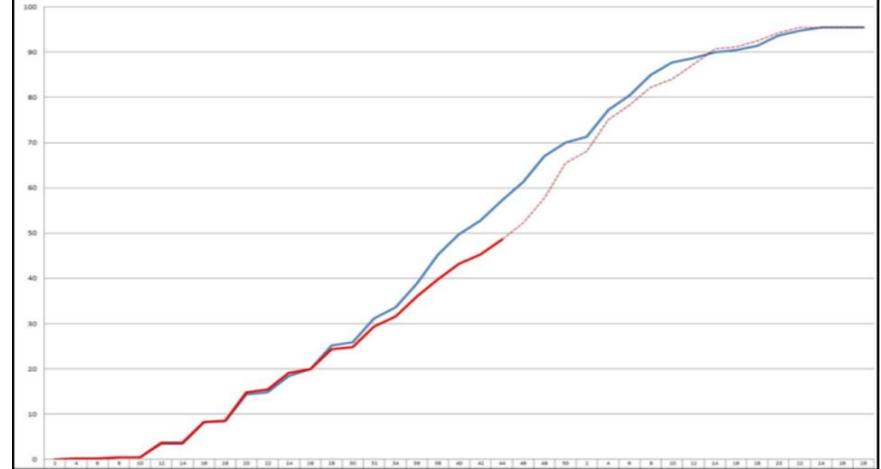

LS1: LHC Injectors status and cable status

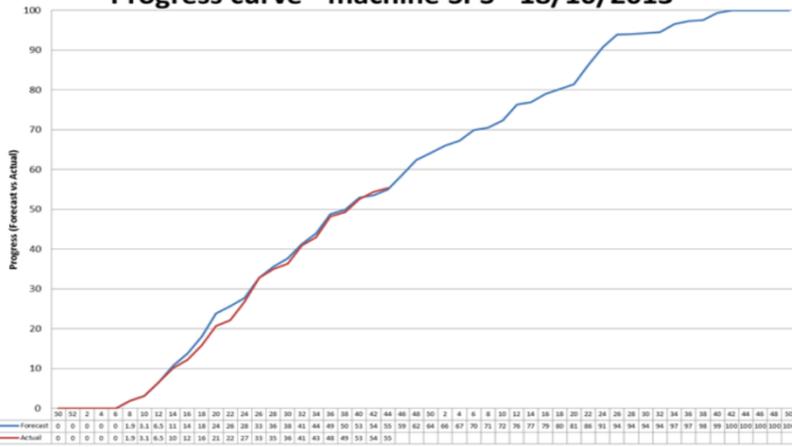

Progress curve - PSB machine - week 44 (120/09/2013)

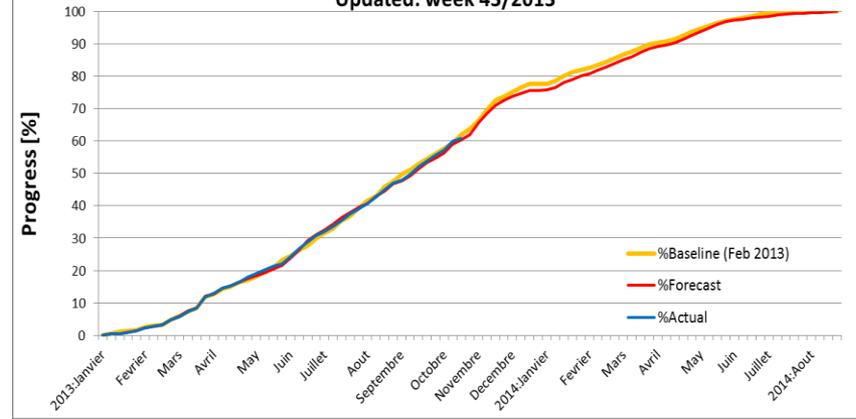

Progress curve - PS machine and TT2 line - week 44/2013

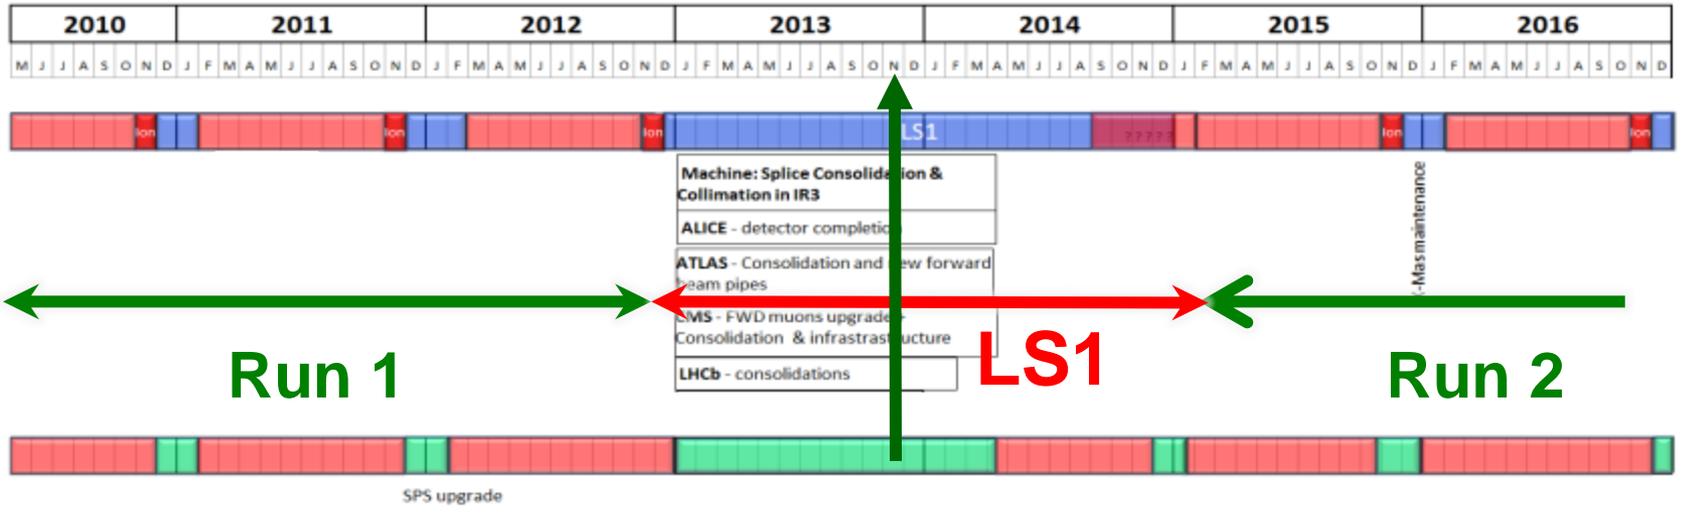

Progress curve - machine SPS - 18/10/2013

Cabling and Optical Fibre Overall Progress curve
Updated: week 43/2013

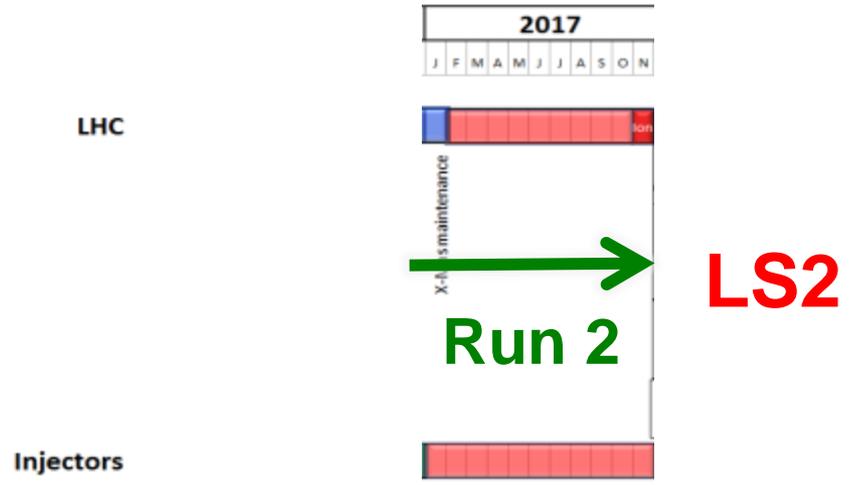

Run2: 3 years Operation Run after LS1

- Machine: Splice Consolidation & Collimation in IR3
- ALICE - detector completion
- ATLAS - Consolidation and new forward beam pipes
- LHCb - FWD muons upgrade
- Consolidation & infrastructure
- LHCb - consolidations

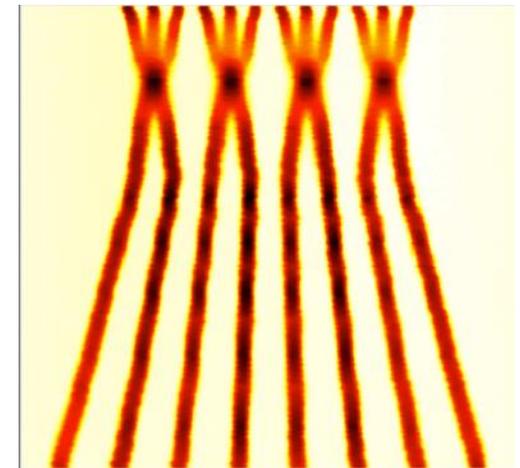

Run 2:
 Start with 6.5 TeV
 and later decision
 towards 7 TeV
 according to magnet
 training

Expectations after Long Shutdown 1 (2015)

- Collisions at least at **13 TeV** c.m.
- **25 ns** bunch spacing
Using new injector beam production scheme (BCMS), resulting in brighter beams.
- $\beta^* \leq 0.5\text{m}$ (was 0.6 m in 2012)
- Other conditions:
 - Similar turn around time
 - Similar machine availability
- Expected maximum luminosity: **$1.6 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1} \pm 20\%$**
 - Limited by inner triplet heat load limit, due to collisions debris

Batch Compression and Merging and splitting (BCMS)

Courtesy of the LIU-PS project team

	Number of bunches	Intensity per bunch	Transverse emittance	Peak luminosity	Pile up	Int. yearly luminosity
25 ns BCMS	2508	1.15×10^{11}	1.9 μm	$1.6 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$	~43	~42 fb^{-1}

Potential performance

	Number of bunches	Ib LHC [1e11]	Collimat or scenario	Emit LHC (SPS) [μm]	Peak Lumi [$\text{cm}^{-2}\text{s}^{-1}$]	~Pile-up	Int. Lumi [fb^{-1}]

*** Invitation Only***

The workshop will focus on:

Review of the parameters of the LIU and HL-LHC projects following the experience and changes in the beam parameters experienced in the past two years

Produce a staged plan (beam parameters, technical work, all machines) of how we proceed from the performance at the end of 2012 to the required performance for the HL-LHC. In order to do this we need to know at what level of integrated luminosity will necessitate replacement of the inner detectors and the insertions. Also to see the importance of 3000fb⁻¹ and what level of minimum integrated luminosity would be tolerated.

DRAFT timetable and session information

*****Deadline for registration: Friday 27 September 2013*****

LS2 : (2018), LHC Injector Upgrades (LIU)

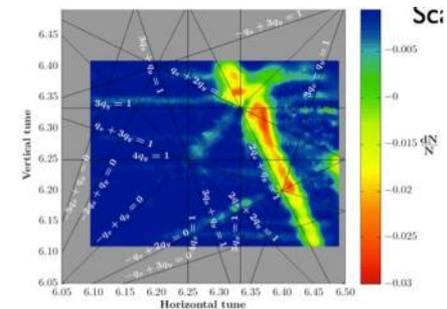

LINAC4 – PS Booster:

- H⁻ injection and increase of PSB injection energy from 50 MeV to 160 MeV, to increase PSB space charge threshold
- New RF cavity system, new main power converters
- Increase of extraction energy from 1.4 GeV to 2 GeV

PS:

- Increase of injection energy from 1.4 GeV to 2 GeV to increase PS space charge threshold
- Transverse resonance compensation
- New RF Longitudinal feedback system
- New RF beam manipulation scheme to increase beam brightness

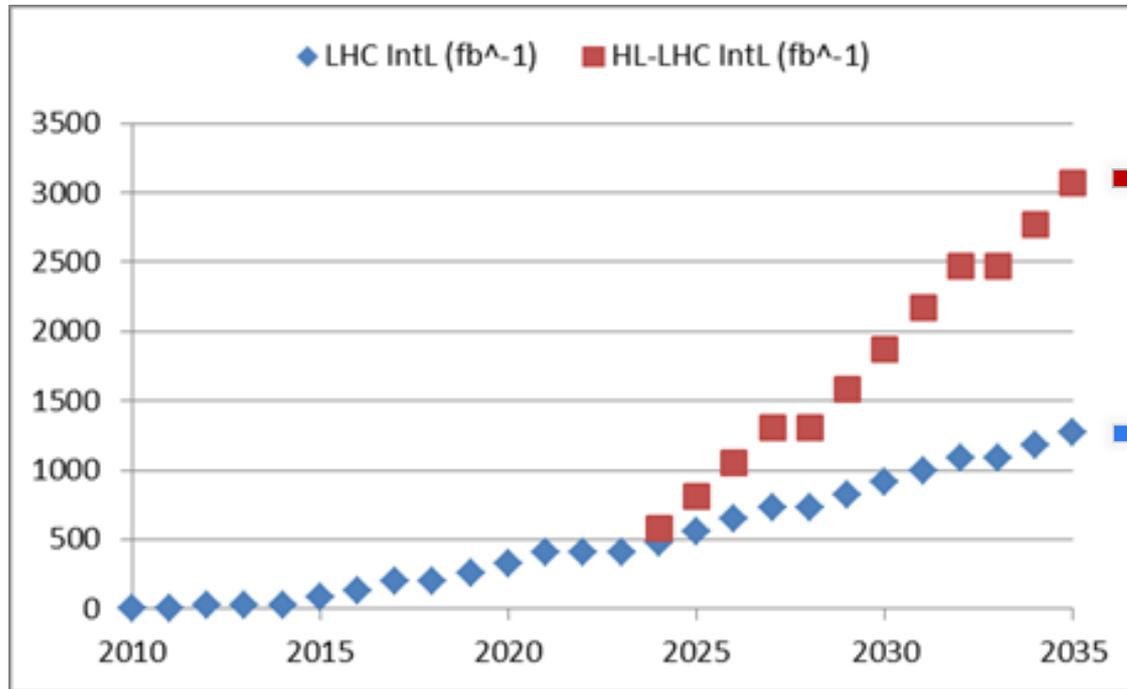

SPS

- Electron Cloud mitigation – strong feedback system, or coating of the vacuum system
- Impedance reduction, improved feedbacks
- Large-scale modification to the main RF system

These are only the main modifications and this list is far from exhaustive

Project leadership: R. Garoby and M. Meddahi

Why High-Luminosity LHC ? (LS3)

By implementing HL-LHC

Almost a factor 3

By continuous performance improvement and consolidation

Goal of HL-LHC project:

- 250 – 300 fb⁻¹ per year
- **3000 fb⁻¹ in about 10 years**

Around 300 fb⁻¹ the present Inner Triplet magnets reach the end of their useful life (due to radiation damage) and must be replaced.

c) *Europe's top priority should be the **exploitation of the full potential of the LHC**, including the high-luminosity upgrade of the machine and detectors with a view to collecting **ten times more data than in the initial design, by around 2030**. This upgrade programme will also provide further exciting opportunities for the study of flavour physics and the quark-gluon plasma.*

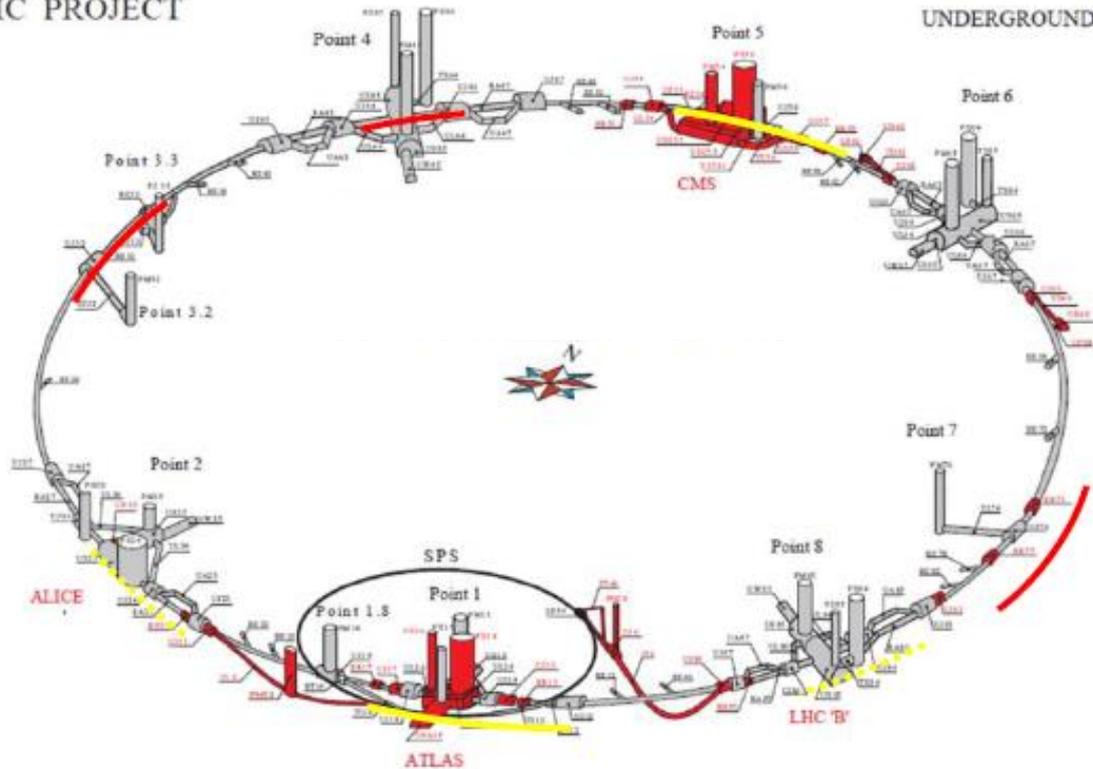

HL-LHC from a study to a PROJECT

$300 \text{ fb}^{-1} \rightarrow 3000 \text{ fb}^{-1}$

including LHC injectors upgrade **LIU**
(Linac 4, Booster 2GeV, PS and SPS upgrade)

The HL-LHC Project

HC PROJECT

- New IR-quads Nb_3Sn (inner triplets)
- New 11 T Nb_3Sn (short) dipoles
- Collimation upgrade
- Cryogenics upgrade
- Crab Cavities
- Cold powering
- Machine protection
- ...

Major intervention on more than 1.2 km of the LHC
Project leadership: L. Rossi and O. Brüning

Squeezing the beams: High Field SC Magnets

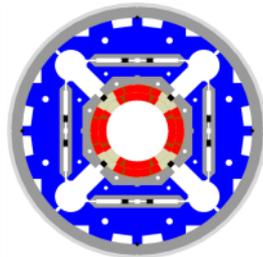

Quads for the inner triplet

Decision 2012 for low- β quads

Aperture \varnothing 150 mm – 140 T/m

($B_{\text{peak}} \approx 12.3$ T)

(LHC: 8 T, 70 mm)

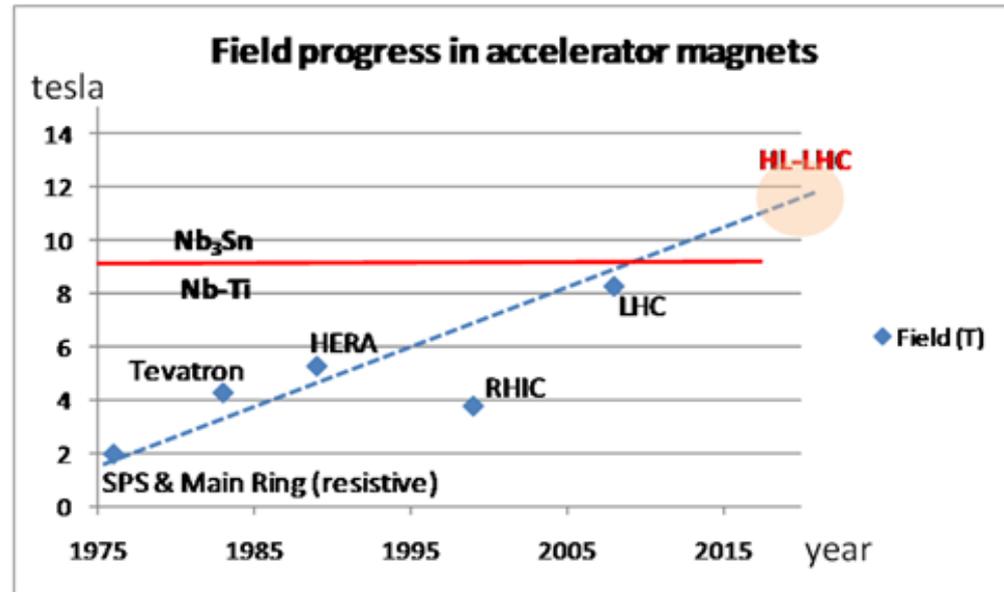

More focus strength,

β^* as low as 15 cm (55 cm in LHC)

thanks to ATS (Achromatic Telescopic Squeeze) optics

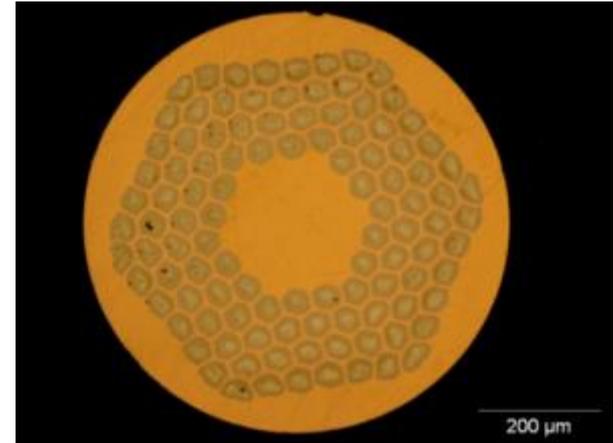

In some scheme even β^ down to 7.5 cm are considered*

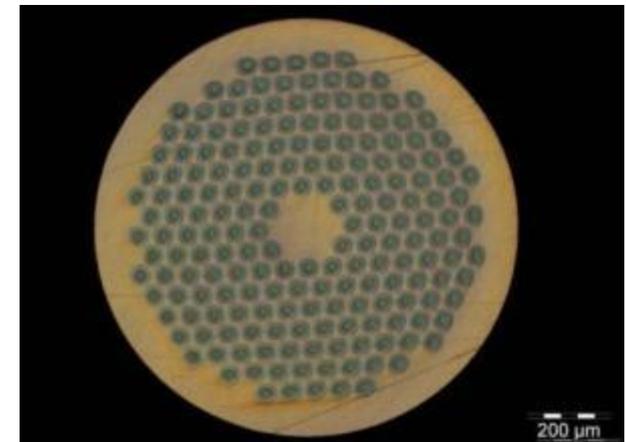

- Dipoles for beam recombination/separation capable of 6-8 T with 150-180 mm aperture (LHC: 1.8 T, 70 mm)
- Dipoles 11 T for LS2 (see later)

The « new » material : Nb₃Sn

- Recent 23.4 T (1 GHz) NMR Magnet for spectroscopy in Nb₃Sn (and Nb-Ti).
- 15-20 tons/year for NMR and HF solenoids. Experimental MRI is taking off
- ITER: 500 tons in 2010-2015!
It is comparable to LHC (1200 tons of Nb-Ti but HL-LHC will require only 20 tons of Nb₃Sn)
- **HEP ITD (Internal Tin Diffusion):**
 - High Jc., 3xJc ITER
 - Large filament (50 μm), large coupling current...
 - Cost is 5 times LHC Nb-Ti

0.7 mm, 108/127 stack RRP from **Oxford OST**

1 mm, 192 tubes PIT from **Bruker EAS**

**LQS01a: 202 T/m at 1.9 K
LQS01b: 222 T/m at 4.6 K
227 T/m at 1.9 K**

**Target:
200 T/m gradient at 1.9 K**

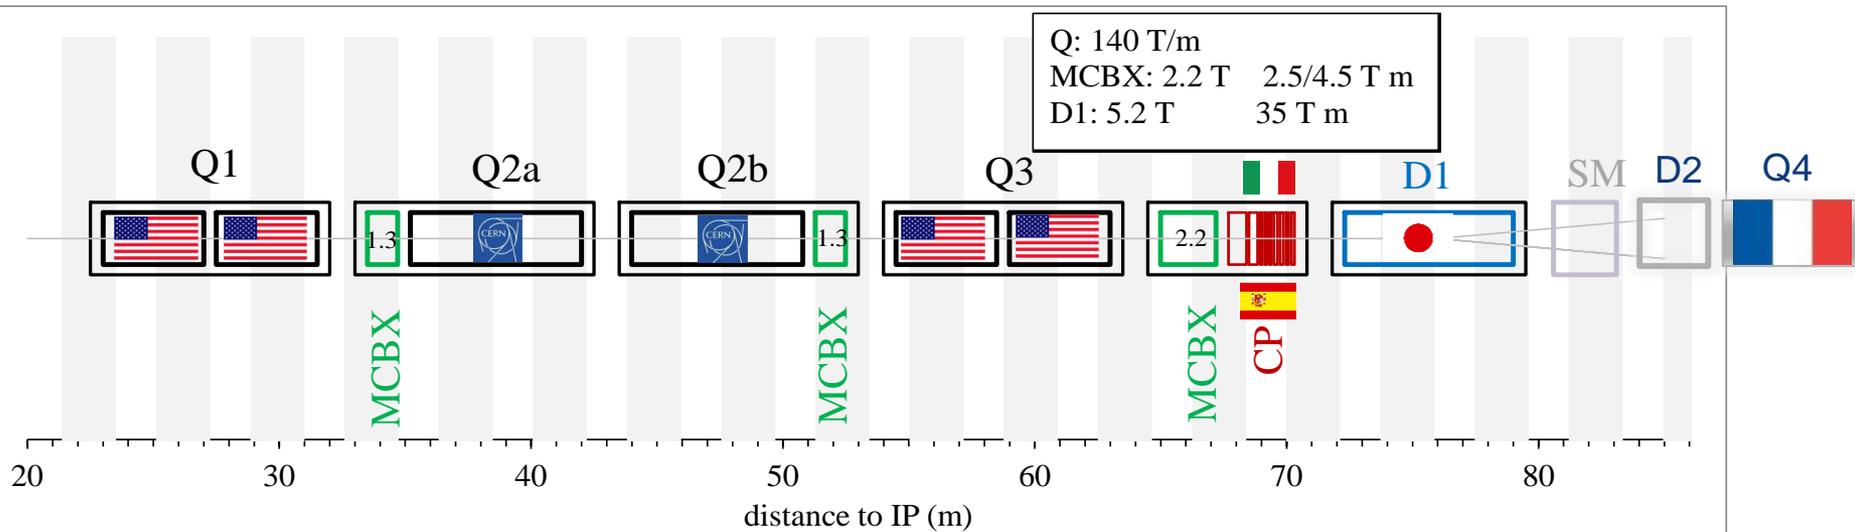

**LQS02: 198 T/m at 4.6 K 150 A/s
208 T/m at 1.9 K 150 A/s
limited by one coil**

**LQS03: 208 T/m at 4.6 K
210 T/m at 1.9 K
1st quench: 86% s.s. limit**

Setting up International collaboration

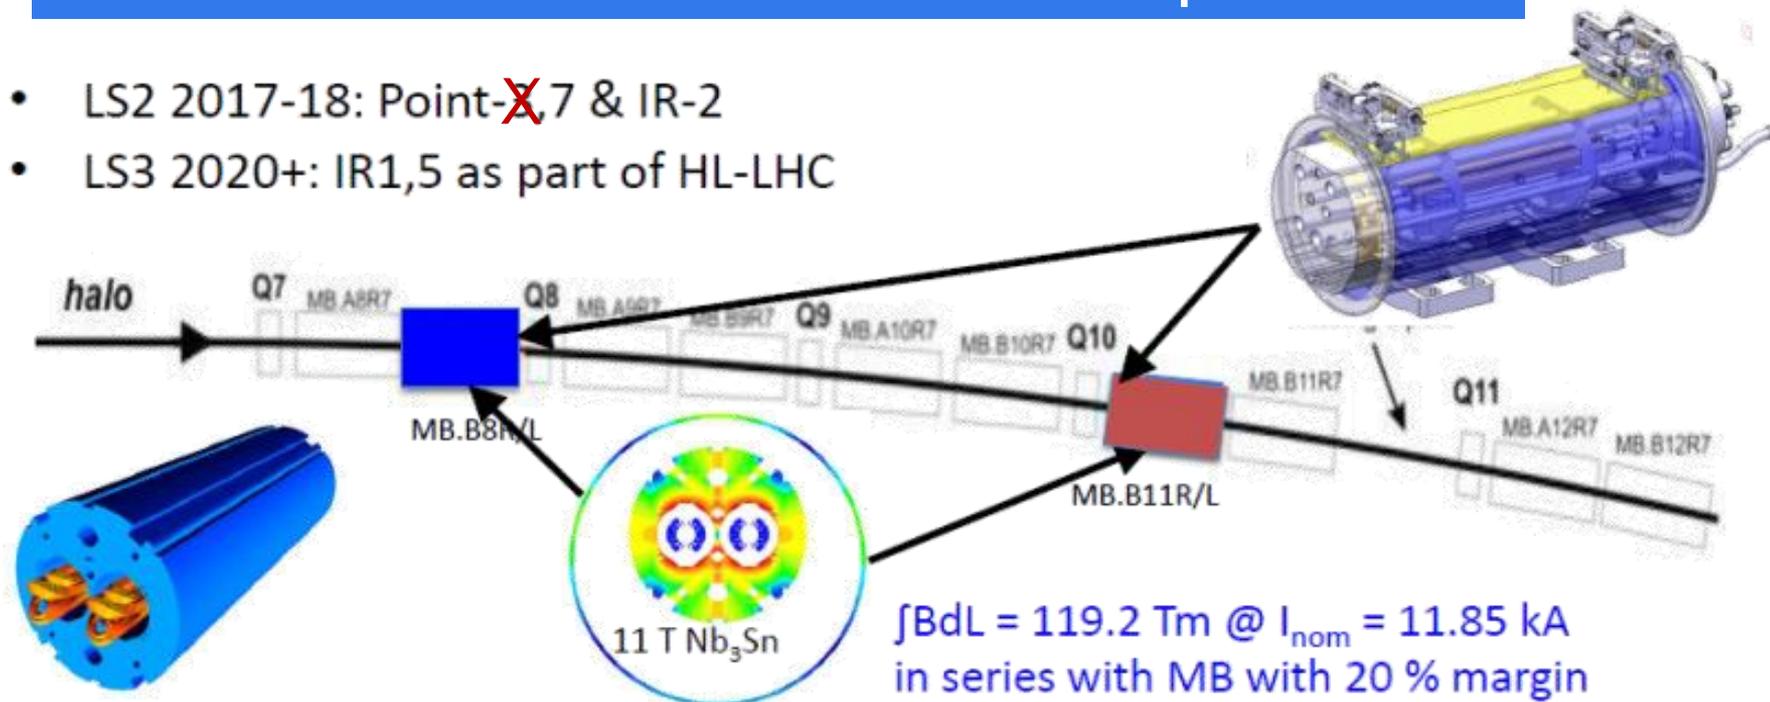

with national laboratories but also involving industrial firms

Baseline layout of HL-LHC IR region

LS2 : collimators and 11T Dipole

- LS2 2017-18: Point-~~X~~,7 & IR-2
- LS3 2020+: IR1,5 as part of HL-LHC

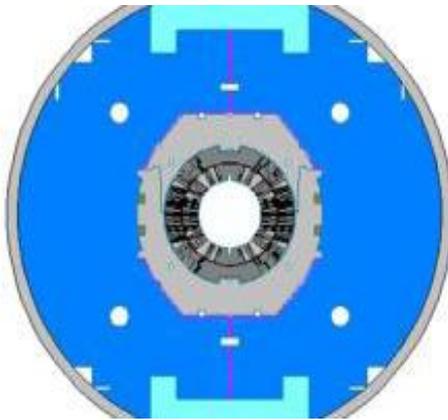

LS2: 12 coldmass + 2 spares = 14 CM
 LS3: 8 coldmass + 2 spares = 10 CM
 Total 24 CM

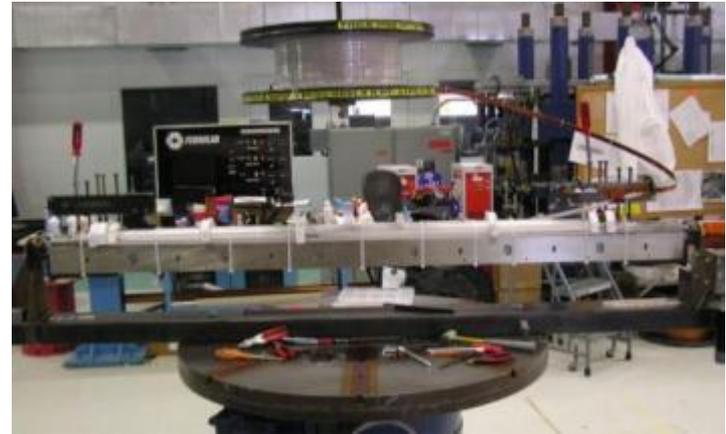

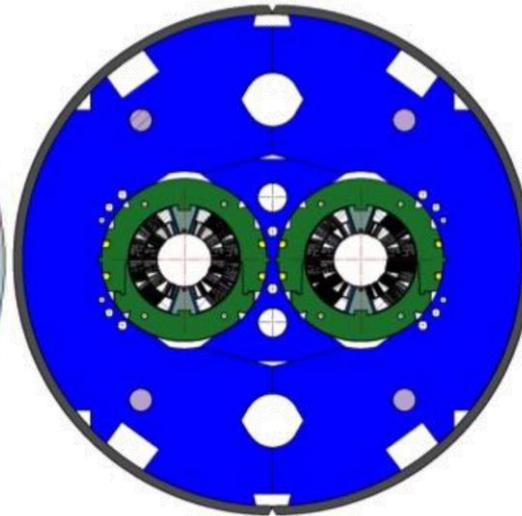

LS2: 24 coldmass + 4 spares = 28 CM
 LS3: 16 coldmass + 4 spares = 20 CM
 Total 48 CM

Nb₃Sn 11T Dipole R&D

Single aperture model

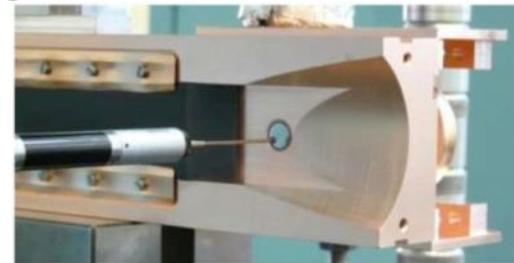

Twin aperture model

IR Collimation Upgrade

Update of present collimation system during LS1:

- Replace existing collimators
- Reduce setup time (gain of factor ~100)
- Improved monitoring

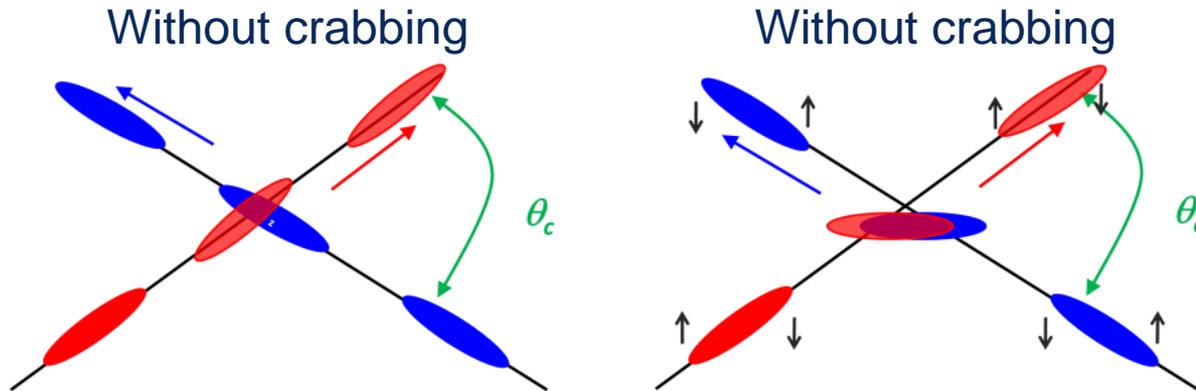

For HL-LHC add dispersion suppressor collimation

- Eliminate off-momentum particles in a region with high dispersion
- Technology of choice for the DS collimators is warm with bypass cryostat
- **low impedance collimators: coating with Molybdenum**
- Design completed with 4.5 m integration length.
- Prototyping on-going

Crab Cavities, Increase “Head on”

Aim: reduce the effect of the crossing angle

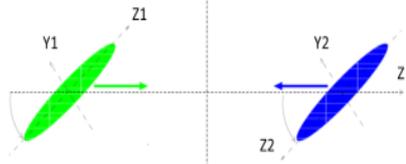

New crossing strategy under study to soften the pile-up density: some new schemas have interesting potential as “crab-kissing”, to be discussed with all experiments

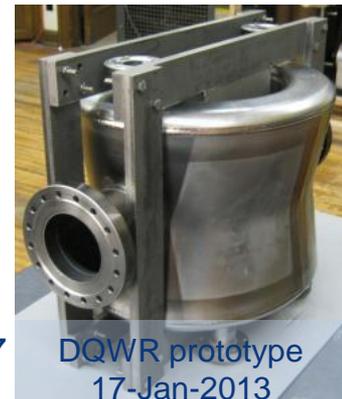

(“Pile-up at HL-LHC and possible mitigation” Stephane Fartoukh)

$\alpha_{||1} = \alpha_{||1} : (y-z)$ normalized angle for B1

$\alpha_{||2} = \alpha_{||1} : (y-z)$ normalized angle for B2

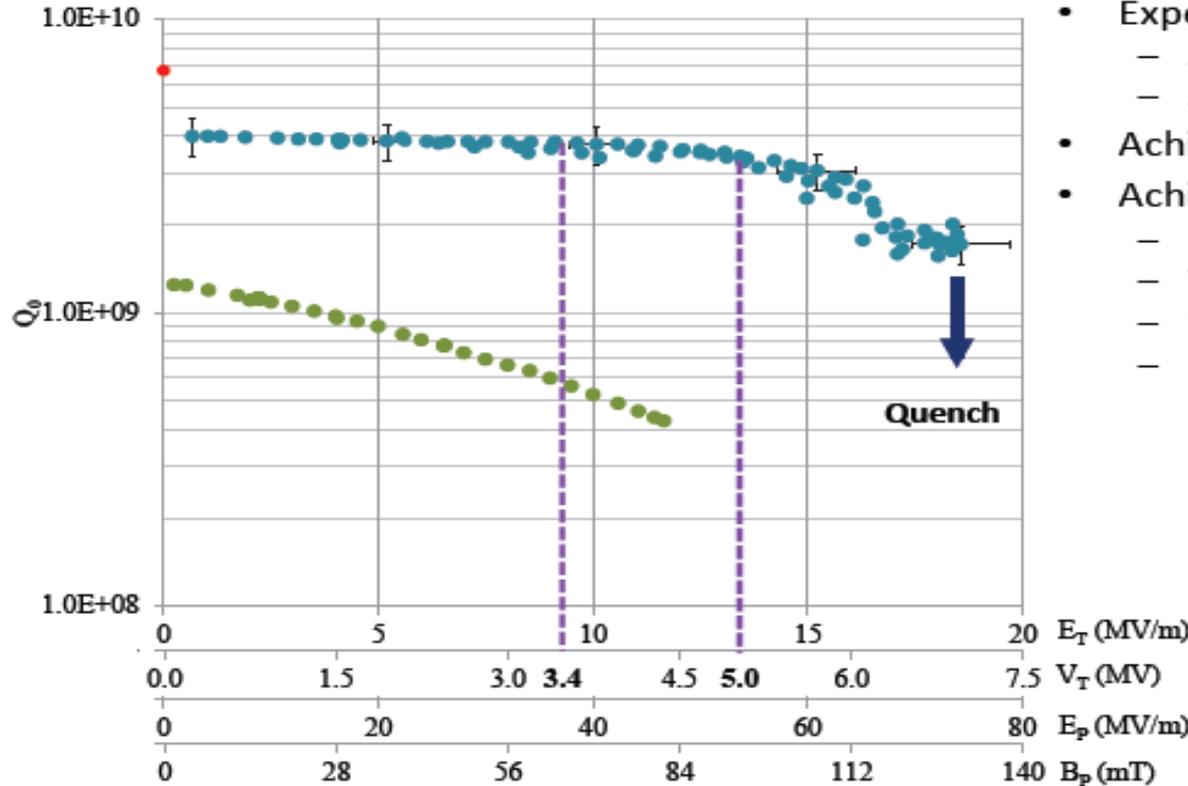

- 3 proto types available
- Cavity tests are on-going
- Test with beam in SPS foreseen in 2015-2016
- Beam test in LHC foreseen in 2017

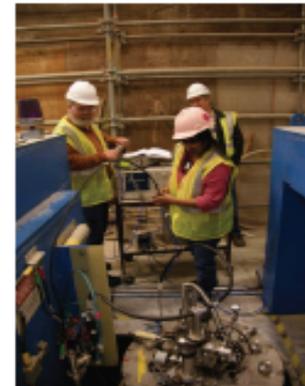

First test of RF dipole (April 2013) (ODU-SLAC at J-LAB)

PoP RF Dipole 4.2 K and 2 K Test Results

- Expected $Q_0 = 6.7 \times 10^9$
 - At $R_s = 22 \text{ n}\Omega$
 - And $R_{res} = 20 \text{ n}\Omega$
- Achieved $Q_0 = 4.0 \times 10^9$
- Achieved fields
 - $E_T = 18.6 \text{ MV/m}$
 - $V_T = 7.0 \text{ MV}$
 - $E_p = 75 \text{ MV/m}$
 - $B_p = 131 \text{ mT}$

Thinking to cryomodule...

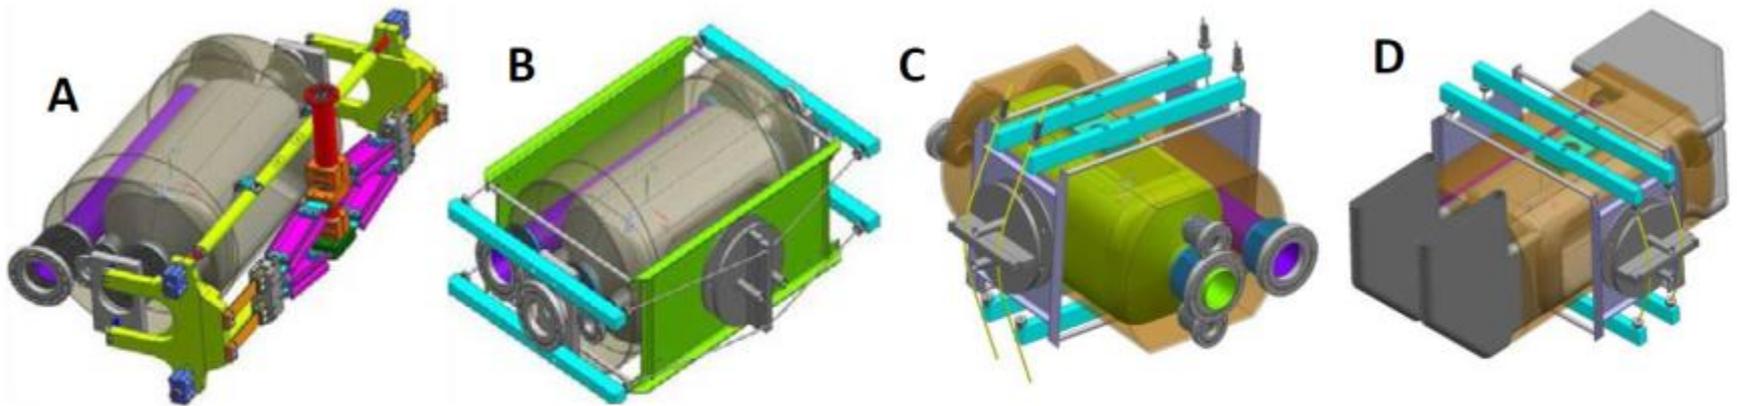

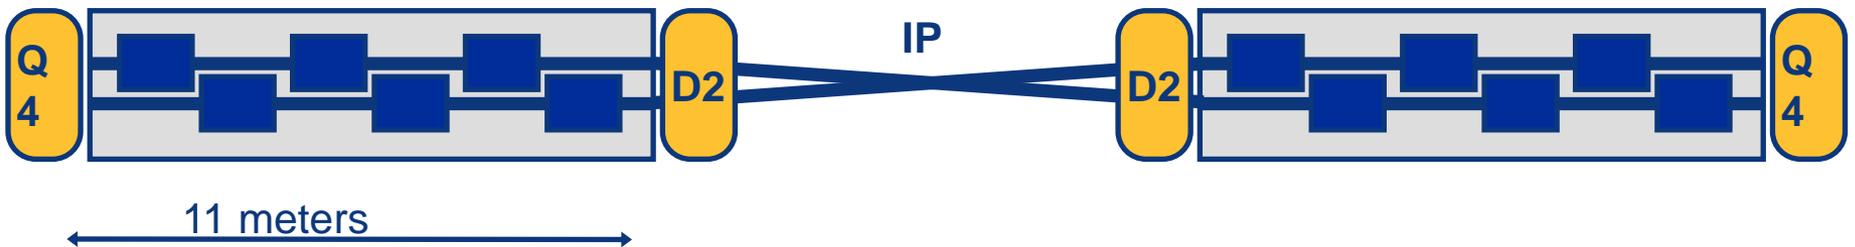

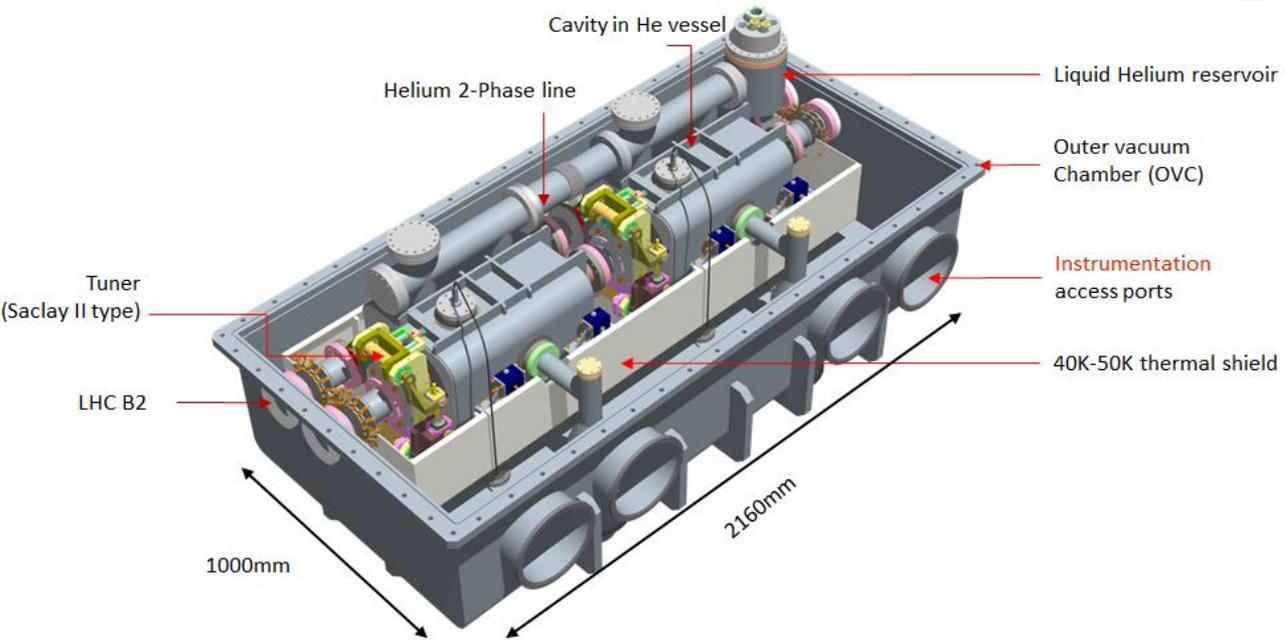

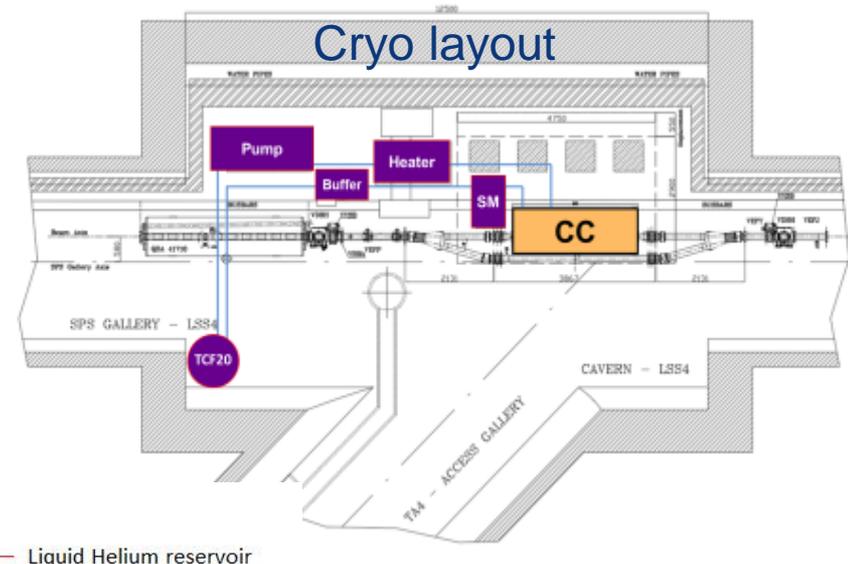

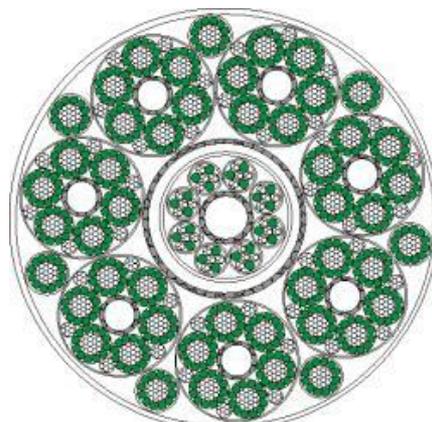

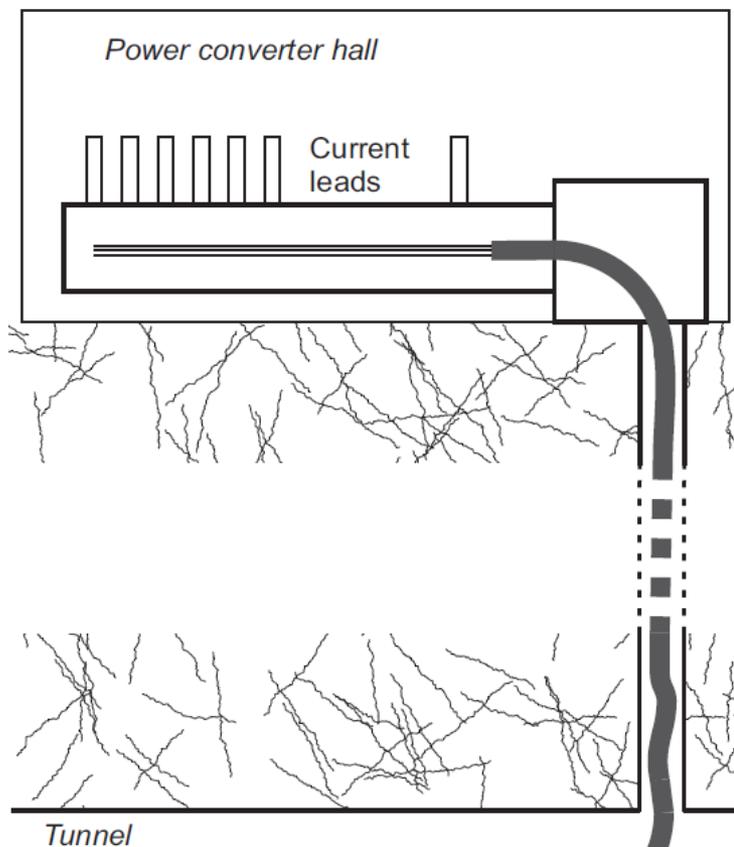

Figure 1: LHC crab cavity cryostat concept – A) JLab design, B) ANL design (helium pressure actuates bellows), C) ANL design (tuner deforms cavity outer surfaces), D) Waveguide

...and to test with beam in the CERN SPS (2016-2017)

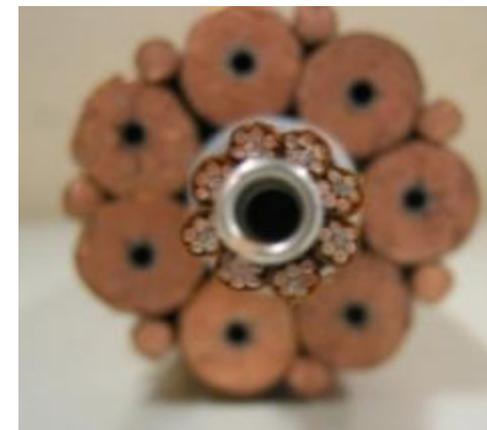

R2E: Removal of Power Converter (200kA-5 kV SC cable, 100 m height)

$\Phi = 62 \text{ mm}$

7 × 14 kA, 7 × 3 kA and 8 × 0.6 kA cables – $I_{\text{tot}} \sim 120 \text{ kA @ } 30 \text{ K}$

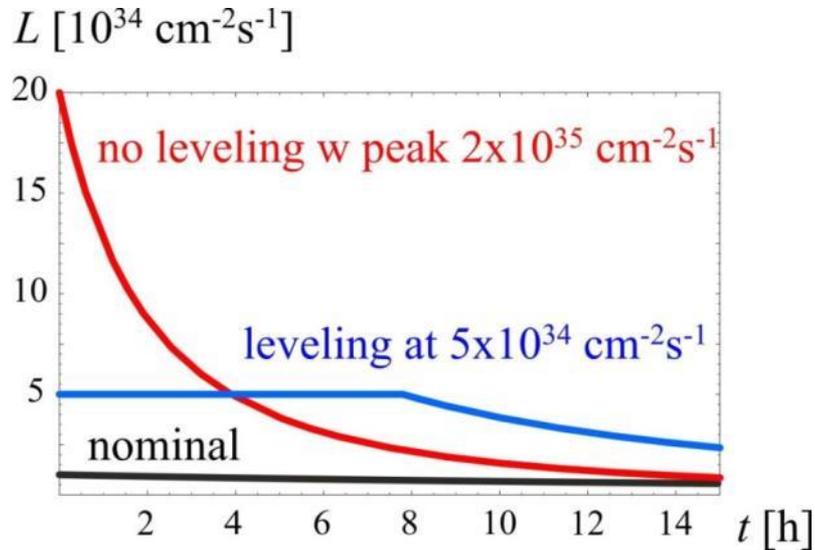

MgB_2
(or other HTS)

Also DFBs (current lead boxes) removed to surface
Final solution to R2E problem – in some points
 Make room for shielding un-movable electronics
Make the maintenance and application of ALARA principle much easier and effective

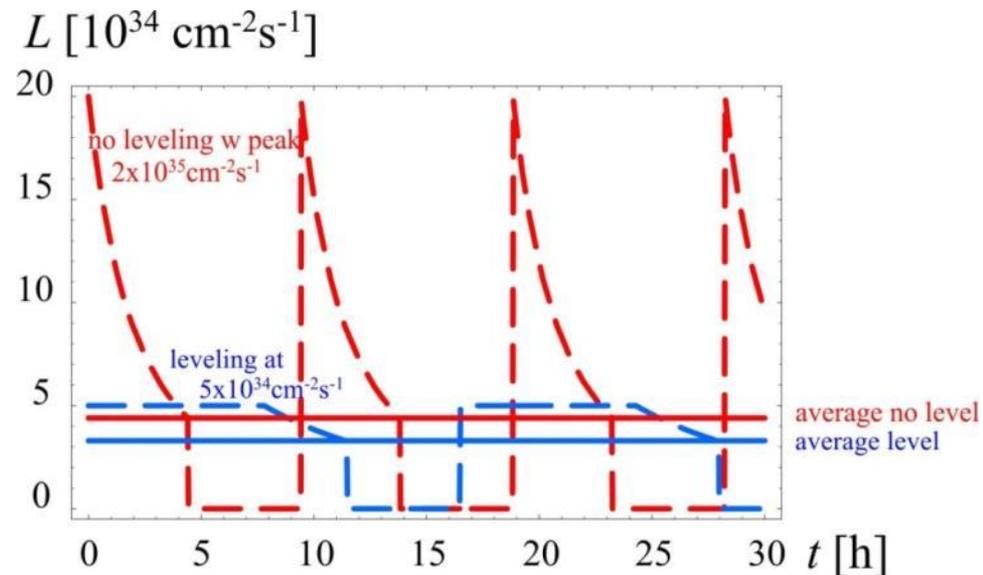

Luminosity Levelling, a key to success

- High peak luminosity
- Minimize pile-up in experiments and provide “constant” luminosity

- Obtain about 3 - 4 $\text{fb}^{-1}/\text{day}$ (40% stable beams)
- About 250 to 300 $\text{fb}^{-1}/\text{year}$

Baseline parameters of HL for reaching 250 -300 fb⁻¹/year

25 ns is the option

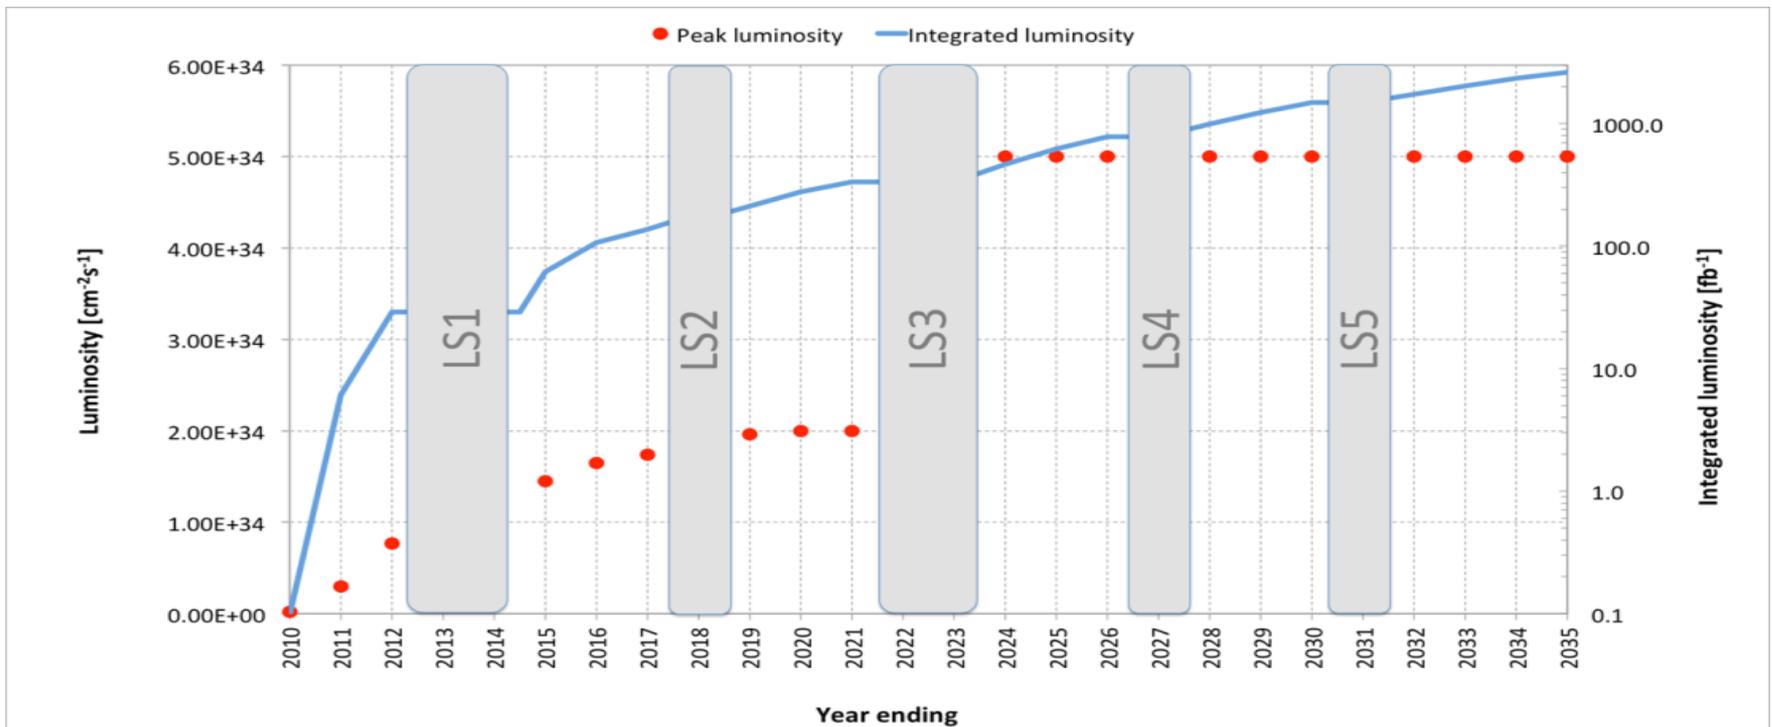

However:

50 ns should be kept as alive and possible because we DO NOT have enough experience on the actual limit (*e-clouds, I_{beam}*)

Continuous global optimisation with LIU

	25 ns	50 ns
# Bunches	2808	1404
p/bunch [10 ¹¹]	2.0 (1.01 A)	3.3 (0.83 A)
ϵ_L [eV.s]	2.5	2.5
σ_z [cm]	7.5	7.5
$\sigma_{\delta p/p}$ [10 ⁻³]	0.1	0.1
$\gamma\epsilon_{x,y}$ [μm]	2.5	3.0
β^* [cm] (baseline)	15	15
X-angle [μrad]	590 (12.5 σ)	590 (11.4 σ)
Loss factor	0.30	0.33
Peak lumi [10 ³⁴]	6.0	7.4
Virtual lumi [10 ³⁴]	20.0	22.7
T _{leveling} [h] @ 5E34	7.8	6.8
#Pile up @5E34	123	247

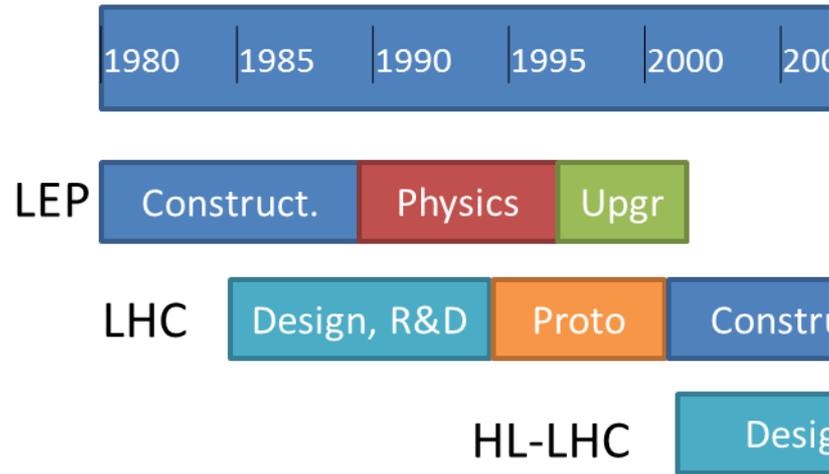

The plan of HL-LHC (baseline)

Levelling at $5 \cdot 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$: 140 events/crossing in average, at 25 ns; several scenarios under study to limit to 1.0 → 1.3 event/mm

Total **integrated luminosity of 3000 fb^{-1}** for p-p by 2035, with LSs taken into account and 1 month for ion physics per year.

“...exploitation of the full potential of the high-luminosity upgrade of the LHC
=> High Luminosity LHC”

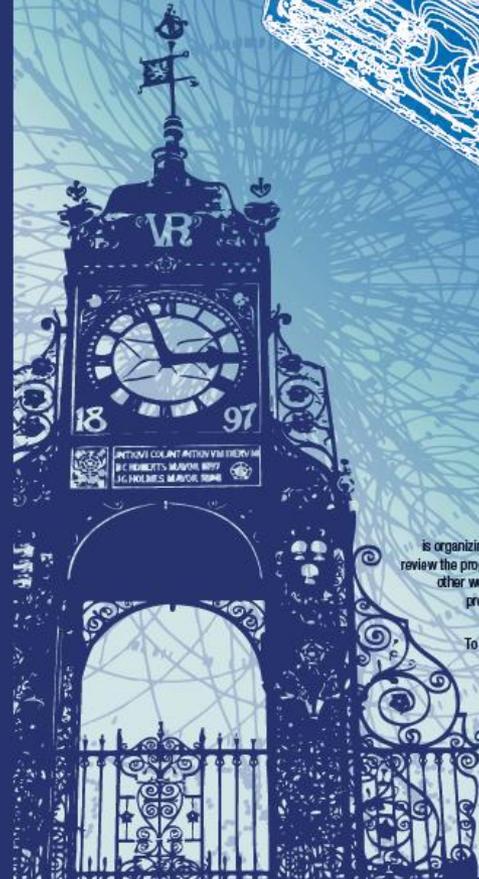

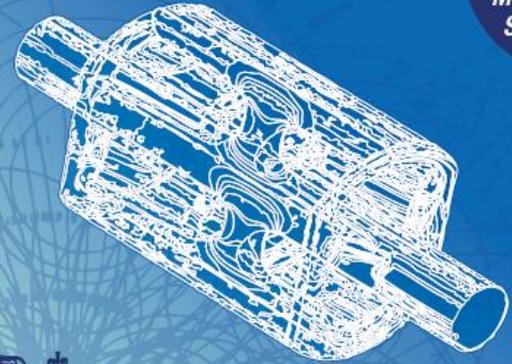

Kick-off meeting: 11th Nov. 2013
(Daresbury)

<http://cern.ch/hilumilhc>

HiLumi LHC-LARP

Daresbury Laboratory, UK
3rd Joint Annual Meeting
11-15 November 2013

High Luminosity LHC Project Kick-off
Monday 11 Nov.
Special Event

Organizing Committee:

- L. Rossi – CERN, Project Coordinator
- O. Brining – CERN, Deputy Project Coordinator
- J. Doubt/ C. Noels – CERN, Projects Support
- R. Appleby – CERN, Chairperson
- D. Angal-Kalinin – STFC
- S. Boegert – JAI
- G. Burt – CERN
- A. Dexter – CERN
- K. Hock – CERN
- L. Kennedy/S. Waller – STFC
- A. Woiski – CERN

The HiLumi LHC Design Study project

is organizing its 3rd Annual Meeting in collaboration with LARP. The meeting will review the progress in design and R&D of the FP7 HiLumi work packages, as well as other work packages. The main scope will be to provide a solid ground for the preparation of the High Luminosity LHC Conceptual Design Report, a key deliverable of the Design Study, due in the first part of 2014.

To mark the recent approval of the High Luminosity LHC project by the CERN Council as first priority for CERN and Europe, a special event called the HL-LHC Project Kick-off will be organized on the afternoon of Monday 11th November, with the participation of directors of the major stakeholders of the project.

The HiLumi LHC Design Study is included in the High Luminosity LHC project and is partly funded by the European Commission within the Framework Programme 7 Capacities Specific Programme, Grant Agreement 2844404.

For more details and free registration:

<http://cern.ch/hilumilhc>

Exploitation of LHC and Future Circular Colliders
Frédéric Bordry
Basics of Accelerator Science and Technology at CERN – CERN

Next Milestones: High Luminosity LHC

Jun. 2014: PDR (Preliminary Design Report) and re-baseline (costing, time) of the project

Sep. 2015: First short model QXF (inner triplet)

Nov. 2015: TDR and end of FP7 Design Study

Sep. 2016: First full size MQXF (long triplet Quad)

2016-17: Test Crab Cavities in SPS

Start Construction

LS2 (2018): Installation in LS2 of Cryogenics P4, SC horizontal link P7, 11 T dipole and DS collimators in P2, first Molybdenum collimators

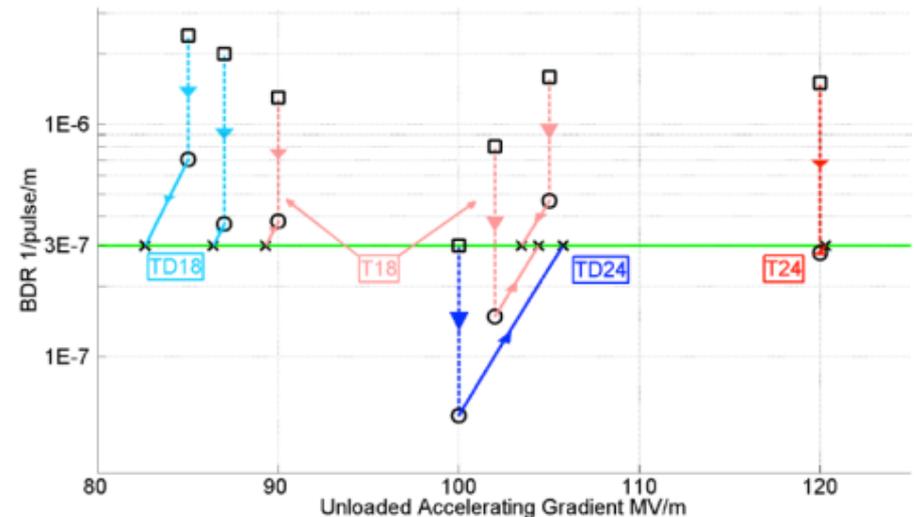

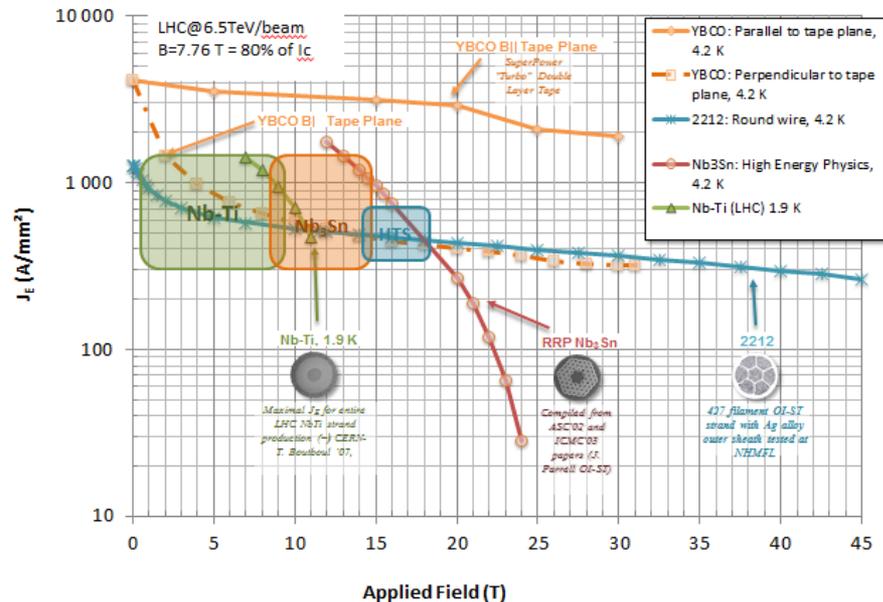

LS3 (2022-23) : installation of all HL-LHC hardware synchronized with long detector shutdown

“to propose an ambitious **post-LHC accelerator project at CERN** by the time of the next Strategy update”

d) CERN should undertake design studies for accelerator projects in a global context, with emphasis on proton-proton and electron-positron high-energy frontier machines. These design studies should be coupled to a vigorous accelerator R&D programme, including **high-field magnets and **high-gradient accelerating structures**, in collaboration with national institutes, laboratories and universities worldwide.**

HFM

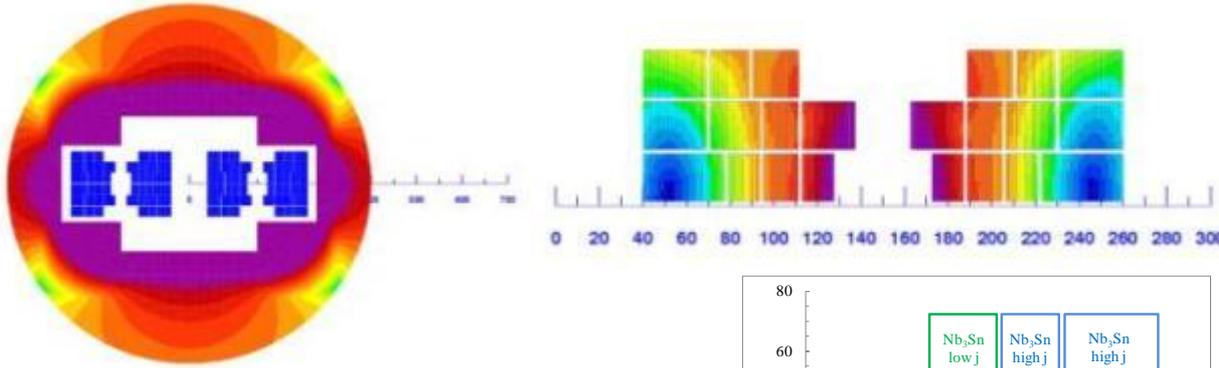

HGA

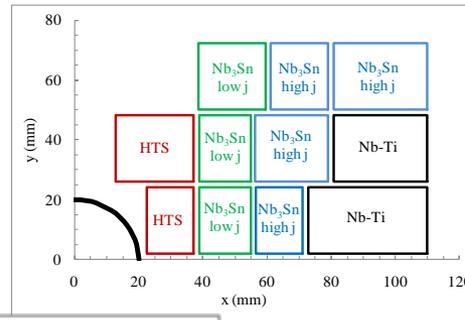

And also R&D on Proton-Driven Plasma Wakefield Acceleration (AWAKE Expt at CERN)

Malta Workshop: HE-LHC @ 33 TeV c.o.m.

14-16 October 2010

Material	N. turns	Coil fraction	Peak field	J _{overall} (A/mm ²)
Nb-Ti	41	27%	8	380
Nb3Sn (high Jc)	55	37%	13	380
Nb3Sn (Low Jc)	30	20%	15	190
HTS	24	16%	20.5	380

Magnet design (20 T): very challenging but not impossible.

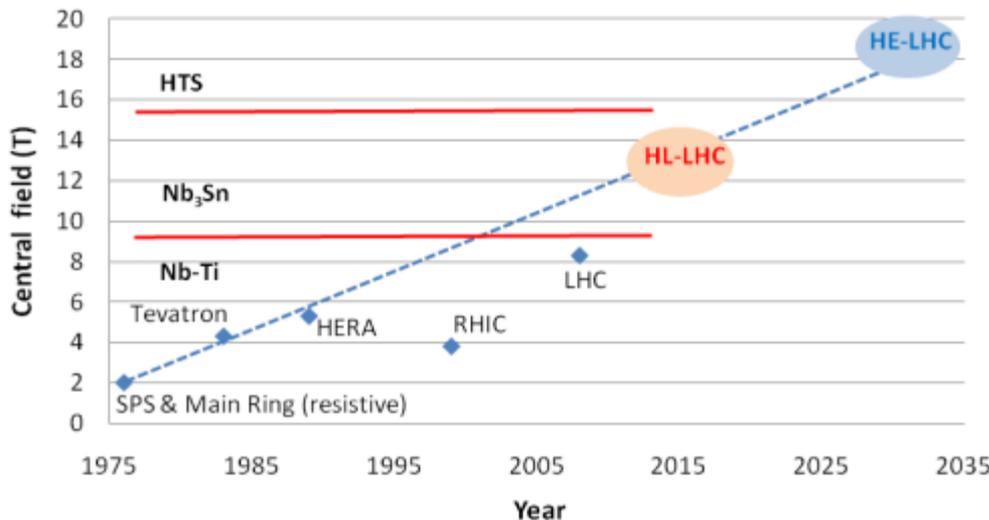

300 mm inter-beam
Multiple powering in the same magnet (and more sectioning for energy)

Work for 4 years to assess HTS for 2X20T to open the way to 16.5 T/beam .

Otherwise limit field to 15.5 T for 2x13 TeV

Higher INJ energy is desirable (2xSPS)

Dipole Field for Hadron Collider

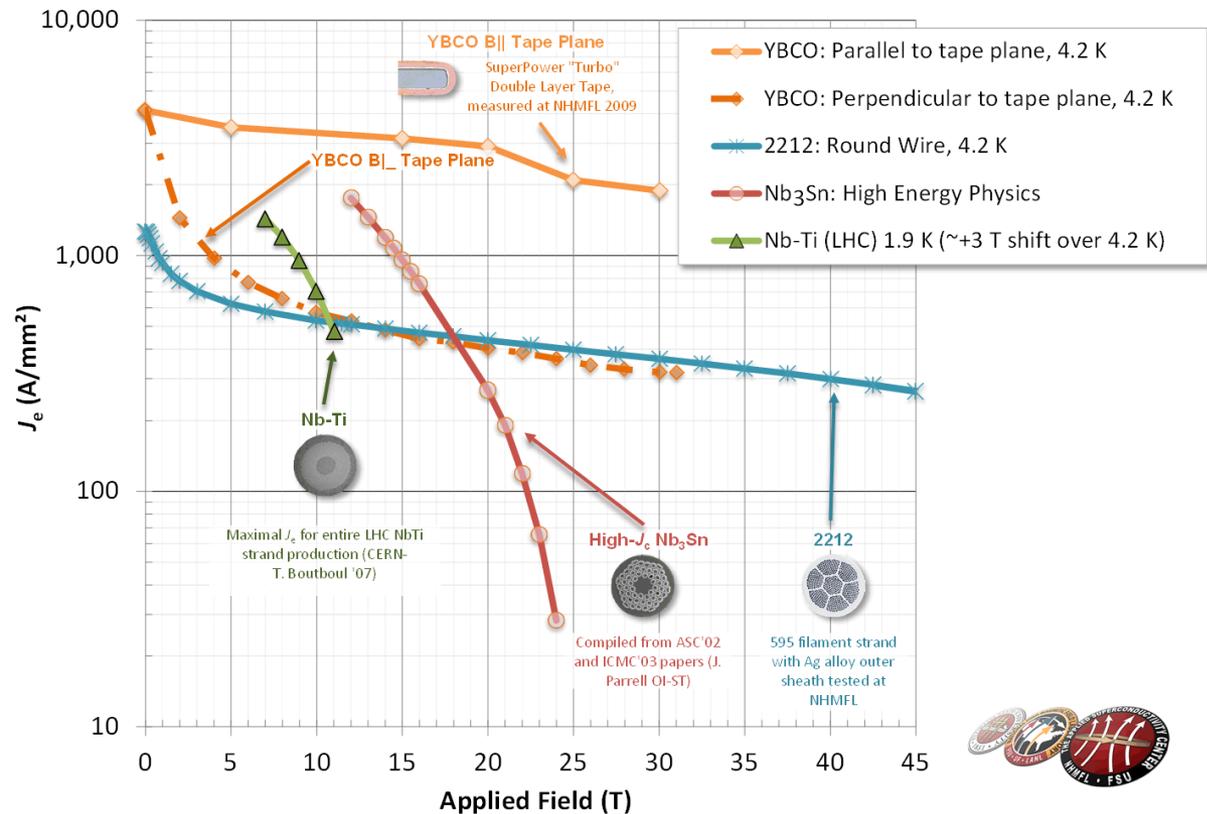

ing the beam screen at 60 K.
ks to dumping time.
C. Reaching 2×10^{34} appears reasonable.
s beam handling for INJ & beam dump:
make twice more room for LHC kickers.

HE-LHC main parameters

parameter	LHC	HL-LHC	HE-LHC
c.m. energy [TeV]		14	33
circumference C [km]		26.7	26.7
dipole field [T]		8.33	20
dipole coil aperture [mm]		56	40
beam half aperture [cm]		~2	1.3
injection energy [TeV]		0.45	>1.0

init. longit. emittance [eVs]		2.5	3.8
no. IPs contributing to ΔQ	3	2	2
max. total b-b tune shift ΔQ	0.01	0.015	0.01
beam current [A]	0.584	1.12	0.478
rms bunch length [cm]		7.55	7.55
IP beta function [m]	0.55	0.15	0.35
rms IP spot size [μm]	16.7	7.1 (min.)	5.2

Superconductors: from materials to applications

Current Density Across Entire Cross-Section

Superconductors as seen by the eye of an engineer

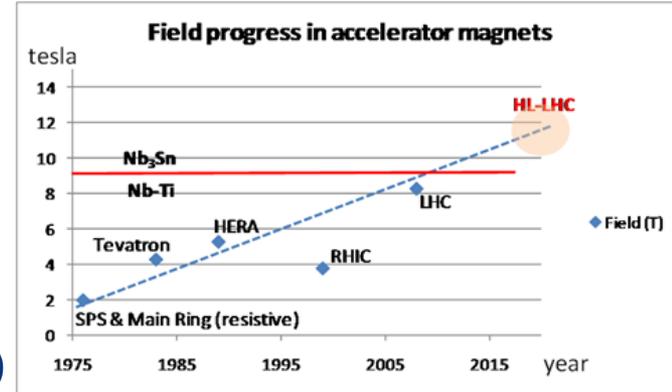

The grand challenge of today is to develop the technology of **high-field superconductors** (field quality,...)

LTS (NbTi ; Nb₃Sn)

NbTi mature but limited to 9T

Is Nb₃Sn mature ? Yes, and no

performance of Nb₃Sn wires has seen a great boost in the past decade (factor 3 in J_C w/r to ITER)

However, Nb₃Sn magnets were never built nor operated in accelerators. Manufacturing, quench, training, protection, strain tolerance, field quality are the focus today to make this new technology a reality

Solid and aggressive R&D in HFM (High Field Magnet) for accelerators must be intensified

HTS

Can HTS displace LTS ? Not today

Much needs to be done to bring this technology to a point where it can be sold as “mature”

Materials have potential that can be exploited

- OPHT for BSCCO-2212
- Thicker layer for YBCO tapes
- The Holy Grail of a round YBCO wire

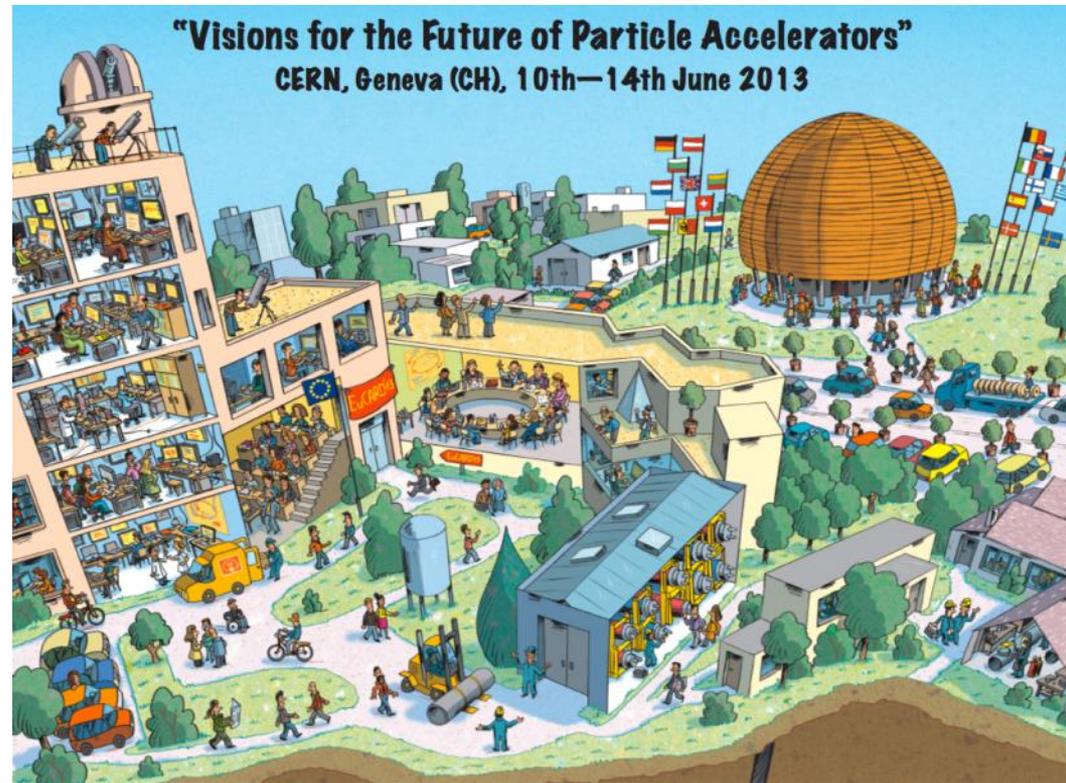

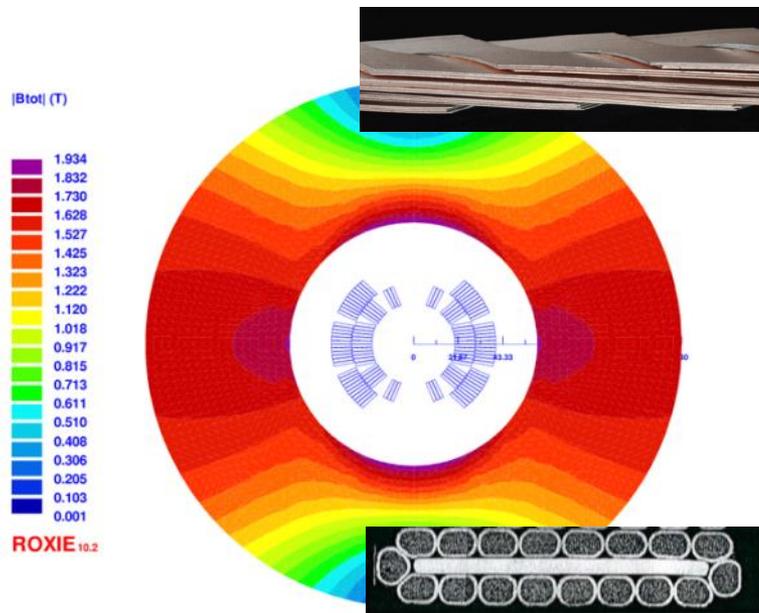

Production quantities, homogeneity and cost need to evolve

Step-up application demands, from self-field (SC-link is an ideal test-bed) to high-field accelerator magnets (feasibility)

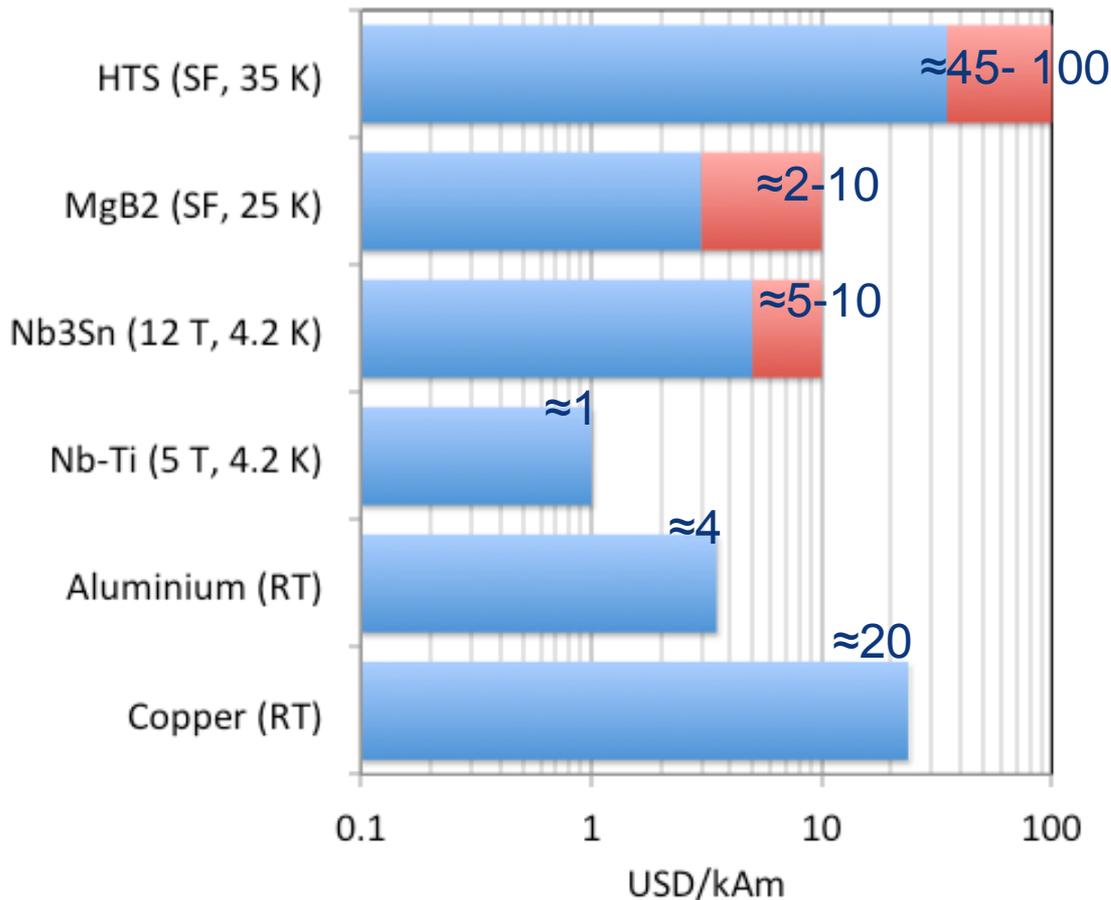

Program Eucard2 on HTS

EuCARD2: Develop 10 kA class HTS accelerator cable using Bi-2212 and YBCO. Test stability, magnetization, and strain tolerance

WP10: a 5 T, 40 mm bore HTS dipole

From materials to applications

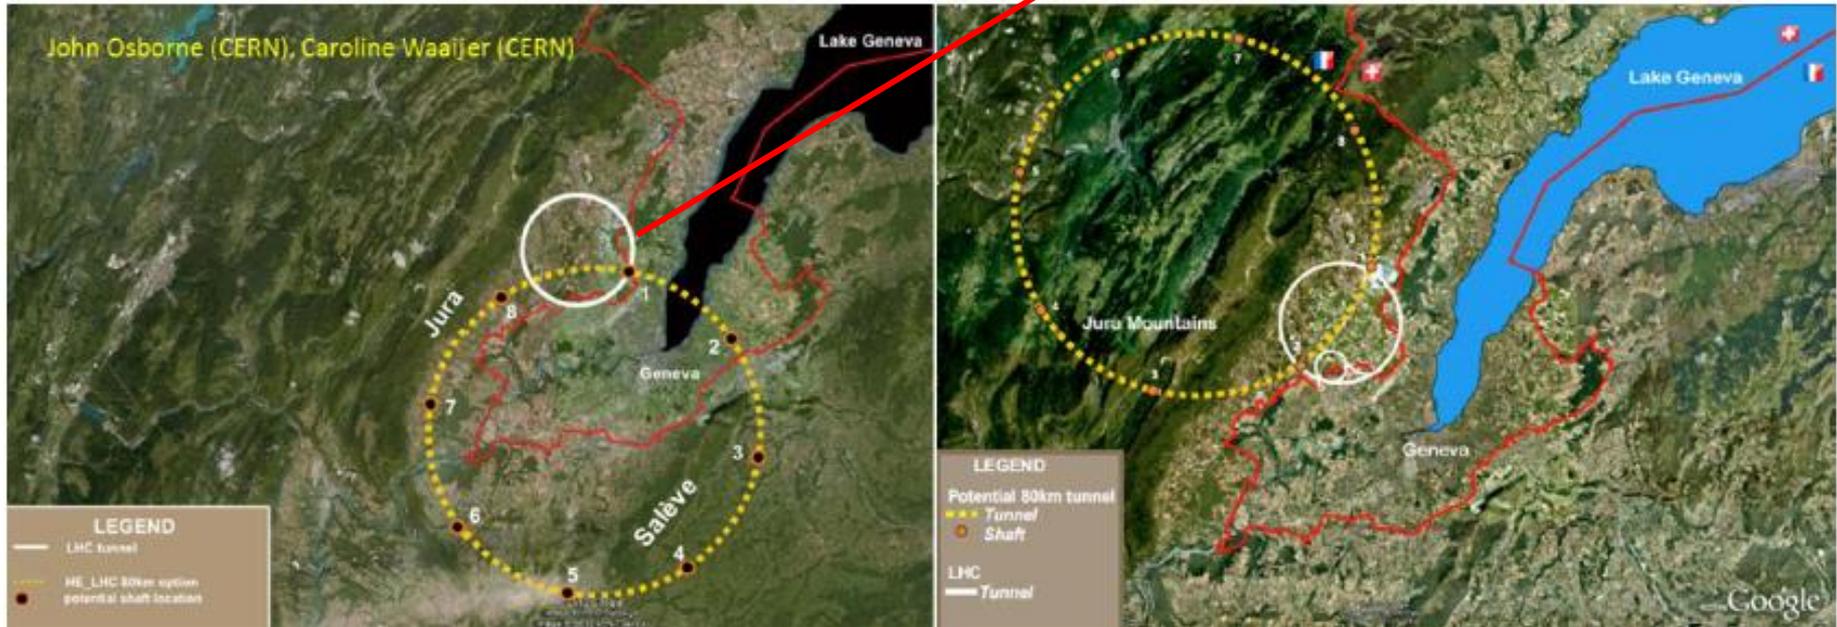

Superconductors
as seen by the eye
of a manager
The grand
challenge of today
is availability of
**long lengths of
reasonably priced
commercial
materials**

"Very High Energy LHC"

First studies on a new 80 km tunnel in the Geneva area

- 42 TeV with 8.3 T using present LHC dipoles
- 80 TeV with 16 T based on Nb₃Sn dipoles
- 100 TeV with 20 T based on HTS dipoles

**HE-LHC :33 TeV
with 20T magnets**

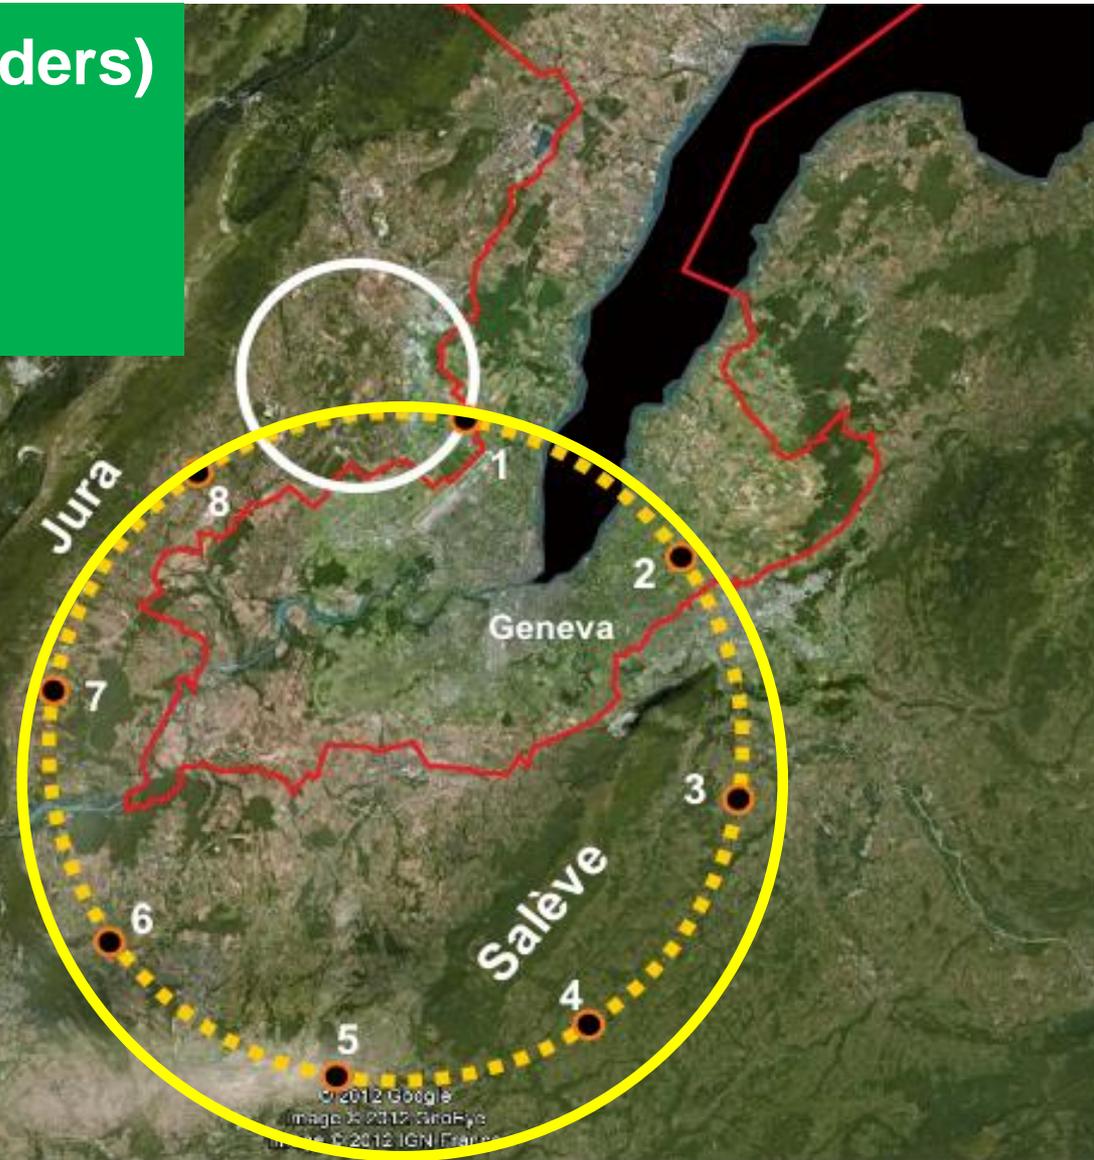

80-100 km tunnel infrastructure in Geneva area – design driven by pp-collider requirements with possibility of e⁺-e⁻ (TLEP) and p-e (VLHeC)

**FCC (Future Circular Colliders)
CDR and cost review
for the next ESU (2018)
(including injectors)**

**16 T ⇒ 100 TeV in 100 km
20 T ⇒ 100 TeV in 80 km**

FCC Study : p-p towards 100 TeV
Kick-off meeting: 12th-14th Feb. 2014

FCC: Future Circular Colliders

Conclusion: “Exploitation of the full potential of the LHC”

- LS1 [2013-2014] : 1st beams in 2015
 - Run 2 : 13 TeV – 25 ns – up to $1.7 \cdot 10^{34} \text{ cm}^{-2} \cdot \text{s}^{-1}$, 40-45 fb^{-1} per year
 - LS2 (higher intensity - LIU) [2018 or 2019]
 - Run 3 (up to $\sim 2.0 \cdot 10^{34} \text{ cm}^{-2} \cdot \text{s}^{-1}$)
- 300 fb^{-1} before LS3**
- **HL-LHC : R&D =>** now an approved project with a kick-off meeting on 11th Nov. 2013
- A lot of technical and operation challenges :**
- Nb3Sn magnets (accelerator field quality) (HFM roadmap)
 - Collimators
 - Superconducting links
 - Crab cavities
 - Increased availability (machine protection,...)
 - ...

Accelerator-experiment interface are central:

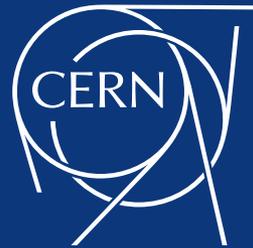

- Bunch spacing, pile-up density, crossing schemas, background, forward detectors, collimation,...

3000 fb^{-1} before 2035

Conclusion cont'd : FCC

- CERN is undertaking an international study for the design of future circular colliders (FCC) in the 100 km range:
CDR and cost review for the next ESU (target 2018)
- Main emphasis is on a hadron collider with a c.m. energy of ~ 100 TeV at the energy frontier, determining the infrastructure.
- The common study will also contain an e^+e^- collider, as potential intermediate step, and look at an e-p option.
- ***Preparation of FCC Design Study kick-off meeting:
12-14th February 2014 in Geneva area***
 - *Establishing international collaborations*
 - *Set-up study groups and study committees*
 - *International Advisory Committee (IAC)*

Thanks for your attention

www.cern.ch

Main parameters for FHC (*VHE-LHC*)

- **energy = 100 TeV c.m.**
- **dipole field = 16 T (baseline)**
[20 T option] (design limit)
- **circumference ~100 km**
- **#IPs = 2**
- total beam-beam tune shift = 0.01
- bunch spacing = 25 ns [10 ...5 ns option]
- **peak luminosity = $5 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$**
- $\beta^* = 1.1 \text{ m}$ [*2 m conservative option*] linked to total beam current ($\sim 0.5\text{-}1 \text{ A}$)

Main parameters for FEC (*TLEP*)

- **energy** = 91-Z, 160-W, **240-H**, 350-t **GeV c.m.**
(energy upgrade 500-ZHH/ttH)
- **circumference** ~100 km
- **total SR power** ≤ 100 MW (design limit)
- **#IPs** = 2 or 4
- beam-beam tune shift / IP scaled from LEP
- **peak luminosity / IP** = 5×10^{34} $\text{cm}^{-2}\text{s}^{-1}$ at Higgs
- top-up injection
- $\beta_y^* = 1$ mm $\sim \sigma_z$

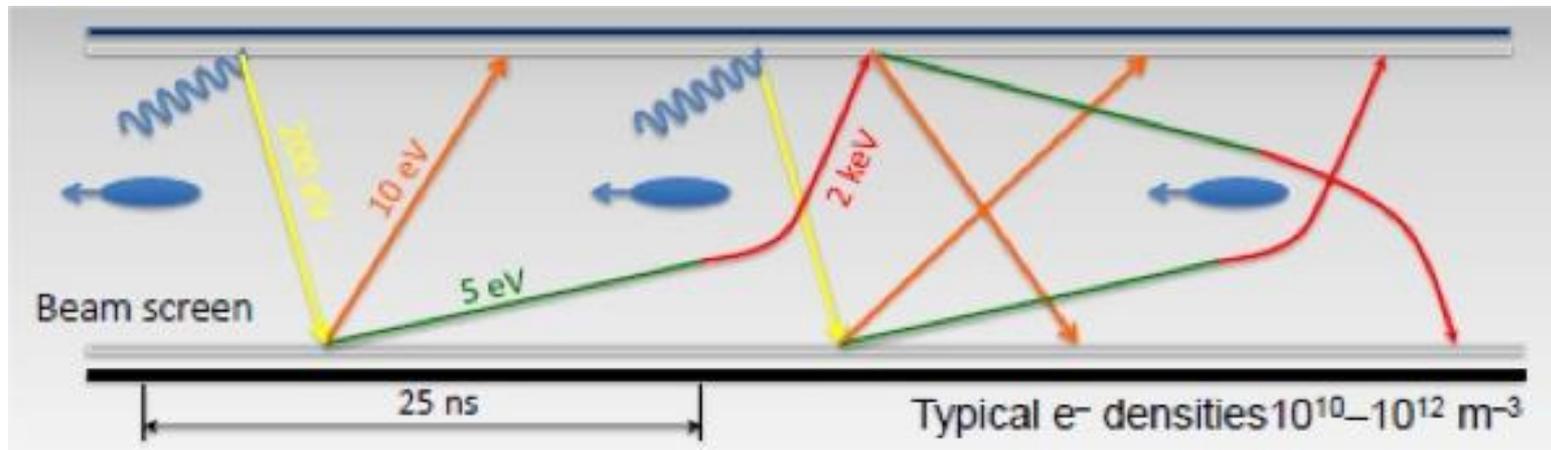

Main parameters FHEC (*VELHC-TLEP*)

- **e- energy = 60, 120, 250 GeV**
- **p energy = 50 TeV**
- spot size determined by p
- e⁻ current from FLC (SR power ≤ 50 MW)
- **#IPs = 1 or 2**

Some Limitations:

Electron cloud

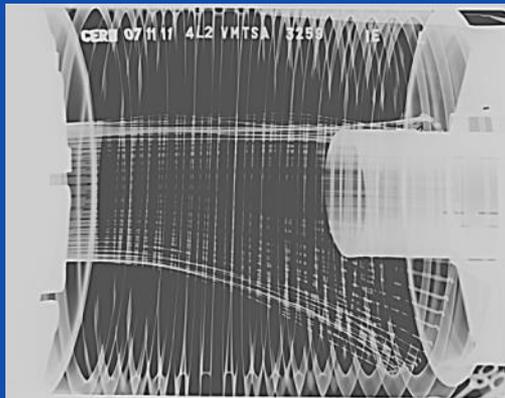

- Reason for running with 50 ns
- Scrubbing to suppress electron cloud build up by reducing the secondary electron yield (SEY)
- Remains still worrisome in the arcs for 25 ns bunch spacing

Some Limitations: cont'd

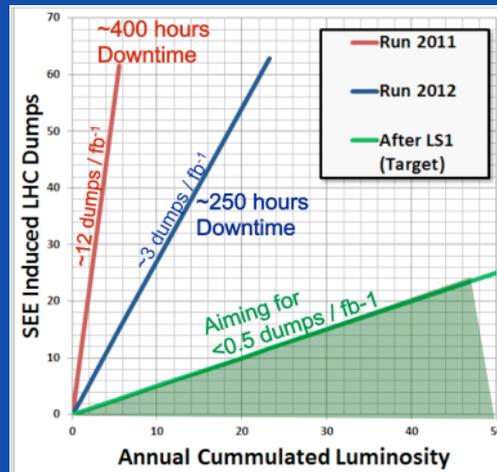

Beam induced heating

- Local non-conformities (design, installation)
 - Injection protection devices
 - Sync. Light mirrors
 - Vacuum assemblies

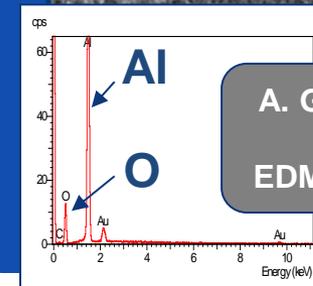

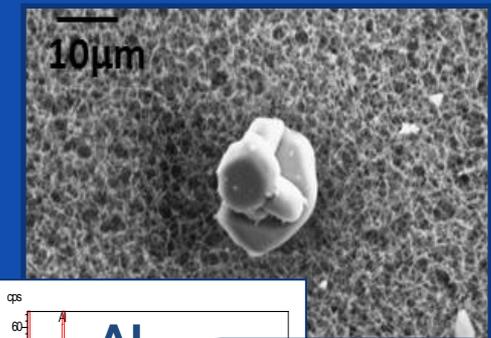

Radiation to electronics

- Concerted program of mitigation measures (shielding, relocation...)
- Premature dump rate down from 12/fb⁻¹ in 2011 to 3/fb⁻¹ in 2012

UFOs

- 20 dumps in 2012
- Timescale 50-200 μ s
- Conditioning observed
- Worry about 6.5 TeV
