Non – ferrous materials for particle accelerators

Ignacio Avilés Santillana
CERN EN / MME – MM
Email: iaviles@cern.ch

Outline

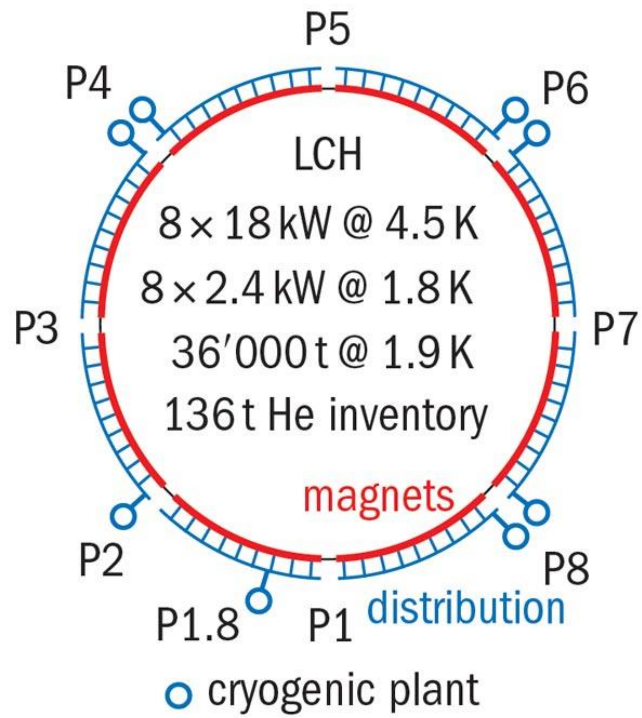
- Environmental conditions of particle accelerators
- General rules for selection of materials in particle accelerators
- Families of non – ferrous materials:
    - Aluminum
    - Copper
    - Titanium
    - Niobium
- Conclusions

Environmental conditions of particle accelerators

- Cryogenic temperatures.
- Ultra – high and extreme vacuum.
- Electro – magnetic fields.
- Radiation.
- High temperatures and high strain rate.

Environmental conditions of particle accelerators

- Cryogenic temperatures → down to 1.9 K (superfluid helium).



- Ul… uun
- El…
- Ra…
- High temperatures and high stra… intercepting devices (dumps, collimators, targets).

Environmental conditions of particle accelerators

- Cryogenic temperatures → down to 1.9 K (superfluid helium).

- Ultra – high and extreme vacuum → down to 10^{-11} mbar.

Classification	Vacuum Level [a], [b], [c], [d]	
	Pa	Torr
Low or "Rough" Vacuum	133.3 to 1.33×10^{-1}	1 to 1×10^{-3}
Intermediate or "Soft" Vacuum	$<1.33 \times 10^{-1}$ to 1.33×10^{-3}	$< 1 \times 10^{-3}$ to 10^{-5}
High or "HV" Vacuum	$<1.33 \times 10^{-3}$ to 1.33×10^{-6}	$< 1 \times 10^{-5}$ to 10^{-8}
Ultrahigh or "UHV" Vacuum	$<1 \times 10^{-7}$ to 1×10^{-8}	7.5×10^{-10} to 7.5×10^{-11}
Extreme Ultrahigh Vacuum	$< 1 \times 10^{-10}$	$< 7.5 \times 10^{-13}$
Interstellar Space	10^{-17}	7.5×10^{-20}

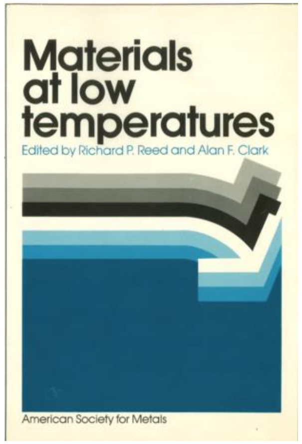
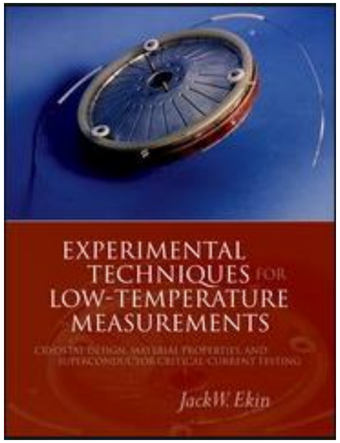
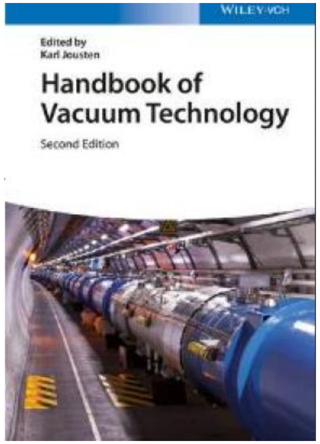
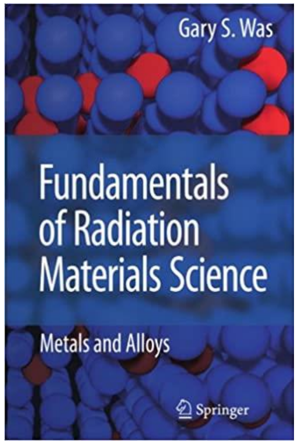
General rules for materials' selection in particle accelerators

- The golden rule to be remembered (from S. Sgobba in stainless steel, can be extended to any material):
  - "A material for an accelerator part is not a mere chemical composition or designation":
    - Specification. Fabrication route. Temper state
    - Controls
    - Price
  - Low / high temperature, magnetism, ultrahigh vacuum, radiation, require special care.

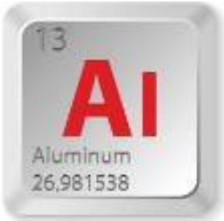








Non – ferrous materials



- Aluminium
  - Second-most abundant metallic element in Earth's crust after silicon.
  - The name comes from its compound form, a mineral rock called ‘alumen’ (meaning binding) used as dyeing fixative.
  - Silver from clay

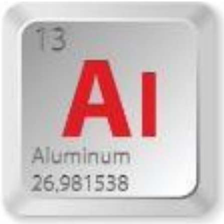
The legend sais that Tiberius beheaded a goldsmith who first crafted aluminium since it could devaluate the price of gold.

Non – ferrous materials

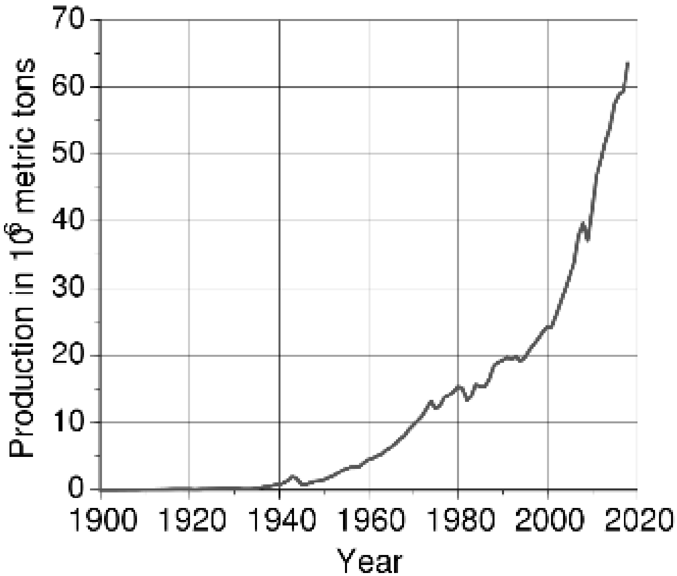
- Aluminium
  - Two millennia after, the extraction of Al from bauxite was very scarce. Al was more precious than gold (as Tiberius feared).

Napoleon III had, for his most distinguished guests, Al cutlery. The rest had to settle for gold.

Non – ferrous materials

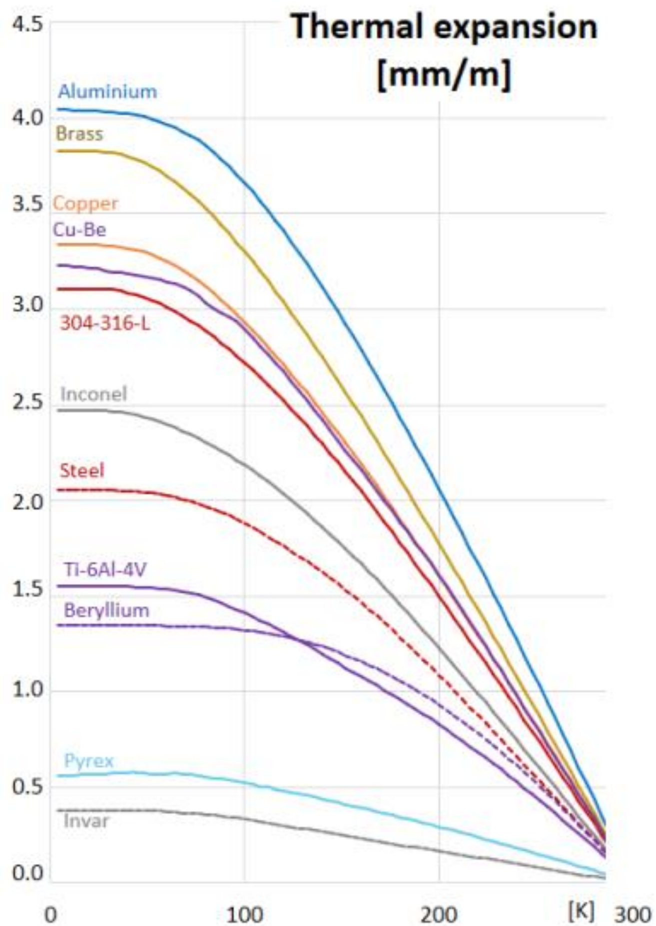


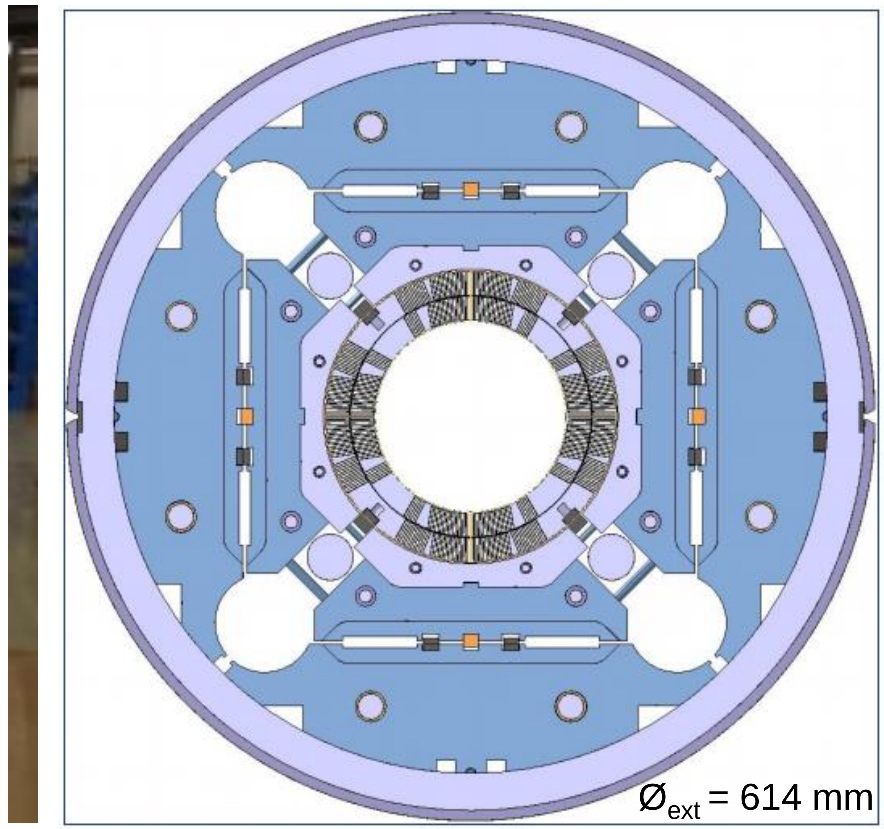
- Aluminium
  - Electrolysis (Hall – Héroult process) of alumina (Bayer process).
  - Victim of its own success: it is produced in greater quantities than all other non-ferrous metals combined



Aluminium for particle accelerators

- Low modulus of elasticity
- High thermal contraction coefficient
- Paramagnetic





Al shells for MQXF quadrupoles

Aluminium for particle accelerators

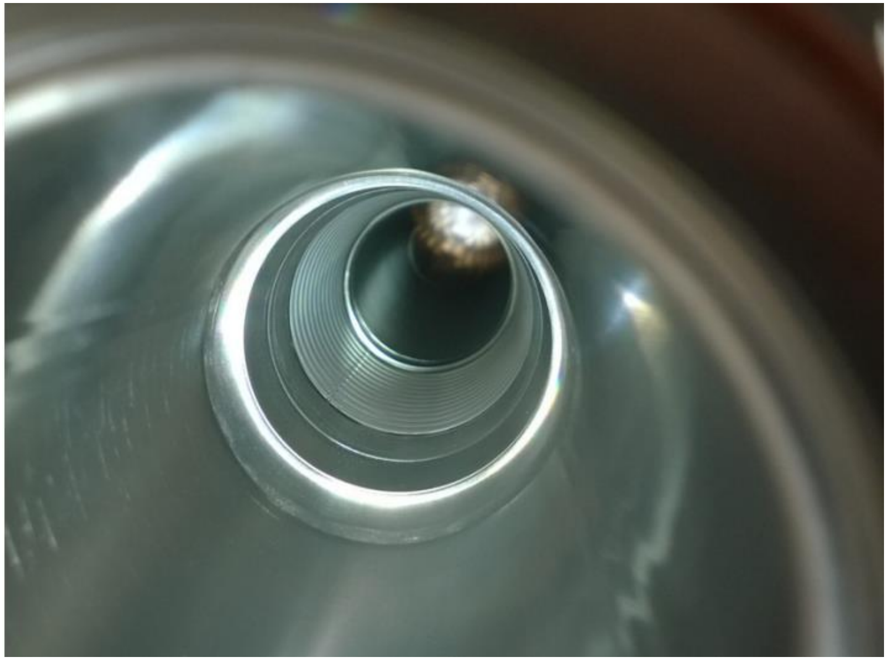
- Very low thermal emissivity
- High thermal and electrical conductivity

MLI (Al coated Mylar) HL – LHC's cold box

Al coil for CERN's first particle accelerator: The Synchrocyclotron

Aluminium for particle accelerators

- Feeble interaction with particle beams
  - Low density
  - Low atomic number



Developments of Al vacuum chambers and bellows

Wrought aluminum alloys

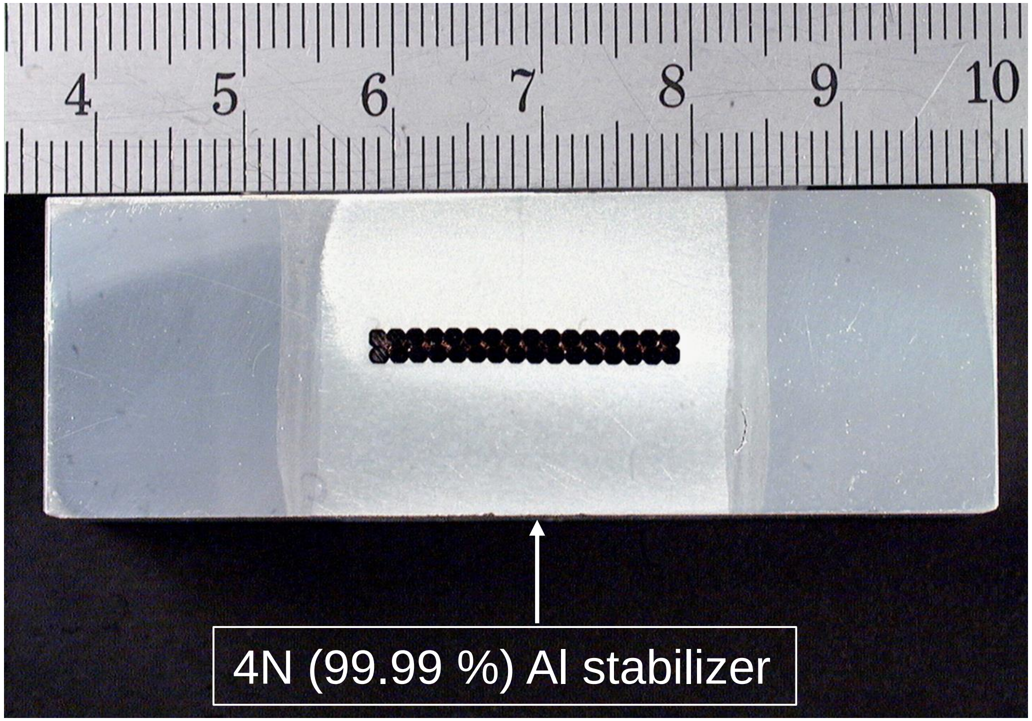
Designation AA	Major alloying elements	Alloy group	Heat treatable ?	Examples
1xxx	-	Pure Al	No	
2xxx	Cu	Al – Cu	Yes	2219
3xxx	Mn	Al – Mn	No	3003
4xxx	Si	Al – Si	No	Filler
5xxx	Mg	Al – Mg	No	5061
6xxx	Mg, Si	Al – Mg - Si	Yes	6082
7xxx	Zn, Mg	Al – Zn	Yes	7050
8xxx	any		(yes)	8090

(blue) → Can be strengthened by a suitable thermal treatment (heat treatable)

(grey) → Can only be strengthened by hot or cold working (non – heat treatable)

Wrought aluminum alloys designations

- 1xxx series (pure Al)

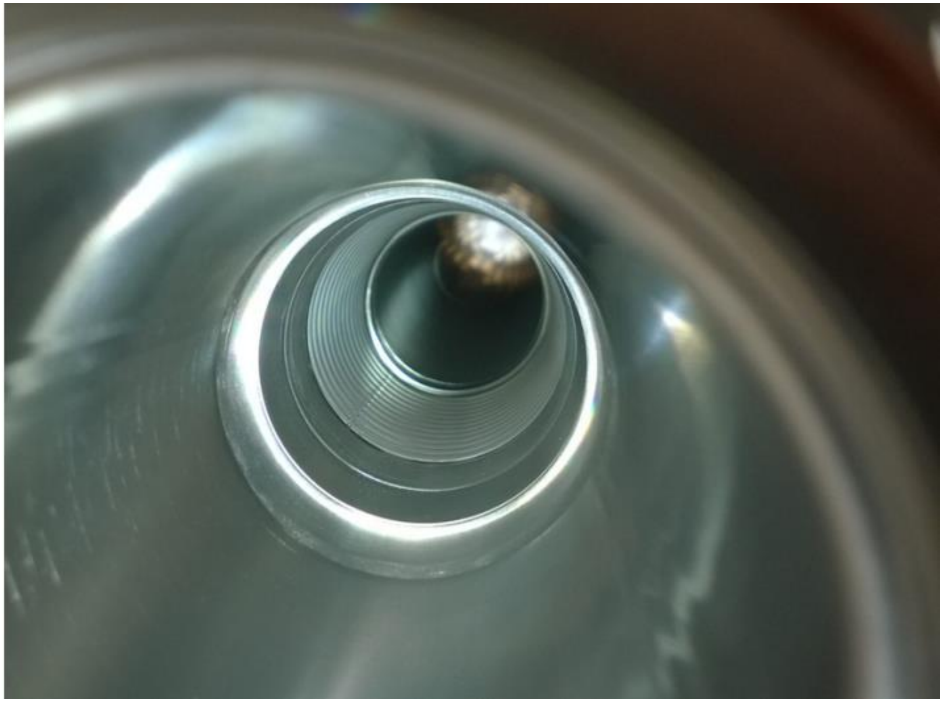


Example: CMS conductor

Wrought aluminum alloys designations

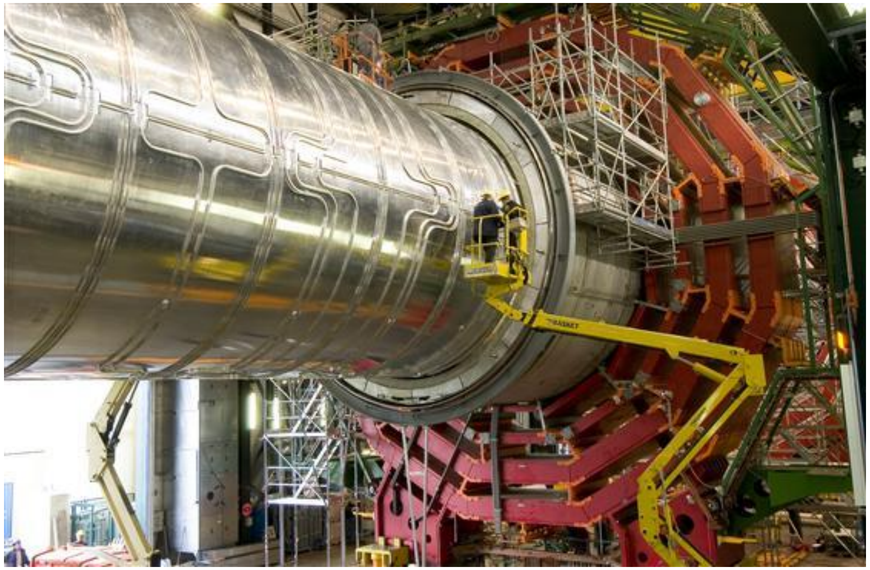
- 2xxx series (Al – Cu)
  - Example: EN AW 2219 T6

Example: vacuum chamber bodies. (NEG coated).



Wrought aluminum alloys designations

- 3xxx series (Al – Mn)
    - Example: EN AW 3003 H22



Example: CMS Solenoid thermal shield

Wrought aluminum alloys designations

- 4xxx series (Al – Si)
  - Major alloying element of this group is silicon, added in sufficient quantities (up to 12%), cause substantial lowering of the melting point without producing brittleness.
  - Al - Si alloys are used in welding wire and as brazing alloys.

Wrought aluminum alloys designations

- 5xxx series (Al – Mg)
  - EN AW 5083 H321 & H116

Example: Mandrels for CMS coil

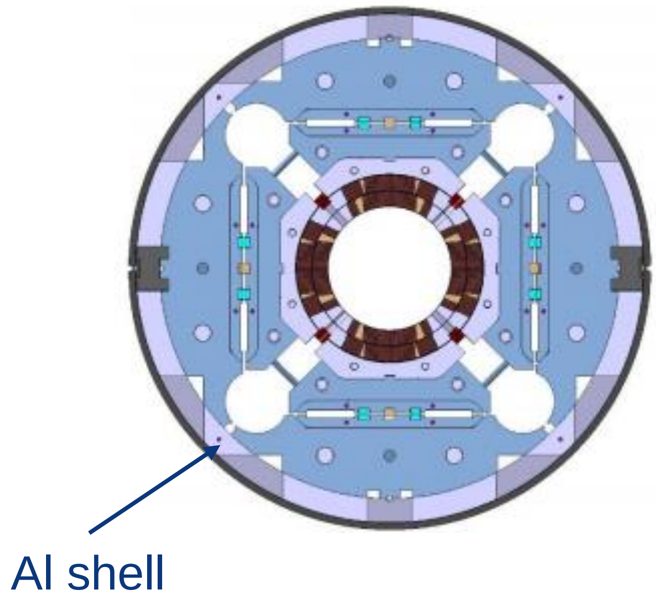
Wrought aluminum alloys designations

- 6xxx series (Al – Mg – Si)
  - Example: EN AW 6082 T6

Example: ICARUS neutrino detector

Wrought aluminum alloys designations

- 7xxx series (Al – Zn – Mg)
  - Example: EN AW 7075 T6



Example: Al shells MQXFBP1 magnet

Wrought aluminum alloys designations

- 8xxx series
  - Reserved for miscellaneous compositions. Alloying elements include: iron, lithium, copper, zinc, magnesium, silicon, manganese, vanadium, zirconium, titanium, chromium & bismuth.
  - Al – Li alloys, for weight reduction. Al - Li alloys possess increased Modulus of Elasticity, high specific stiffness, increased fatigue strength and cryogenic strength.

Wrought aluminum alloys: temper states

Alphanumeric designations that contain information about the thermomechanical history of the material to achieve the desired properties.

AA 7075	Min.	Max.	Approx
Plates, sheets; Annealed (O); 0.20 <= t <= 0.36 mm; Nominal thickness			
Yield stress, $R_{p0,2}$ (MPa)	-	145	-
Tensile stress, R_m (MPa)	-	276	-
Elongation, A (%)	9	-	-
	L_o = 50.8 mm or 4D		

AA 7075	Min.	Max.	Approx
Plates; Solution heat treated and artificially aged (T651); 0.20 < t <= 0.28 mm; Nominal thickness			
Yield stress, $R_{p0,2}$ (MPa)	434	-	-
Tensile stress, R_m (MPa)	510	-	-
Elongation, A (%)	5	-	-
	L_o = 50.8 mm		

Wrought aluminum alloys: temper states

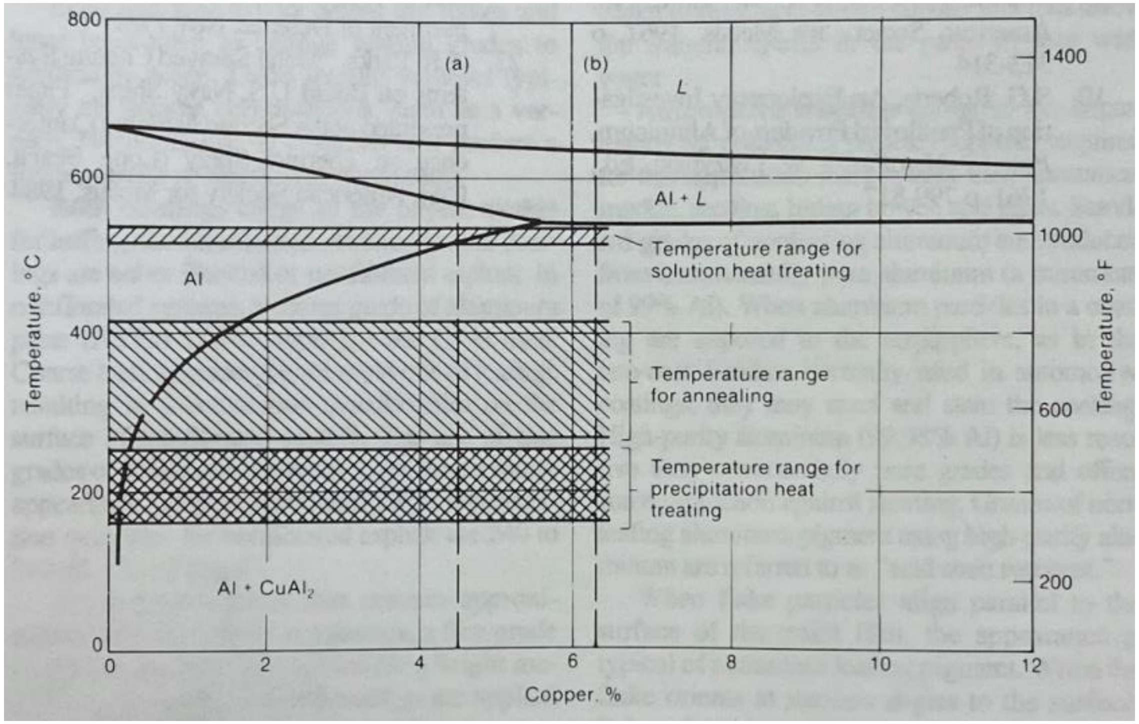
materials
"Men are like ~~steel:~~ if they loose their temper, they loose their worth"

Wrought aluminum alloys: temper states

A capital letter indicating the major class of fabrication treatment(s) used + one (or more) numbers providing more specific information about how the processing was carried out.

Wrought aluminum alloys: temper states

- **O, annealed:** given a high – temperature treatment, sufficient to remove the effects of prior working, usually resulting in complete recrystallization of the material. Lowest strength and maximum ductility and toughness.

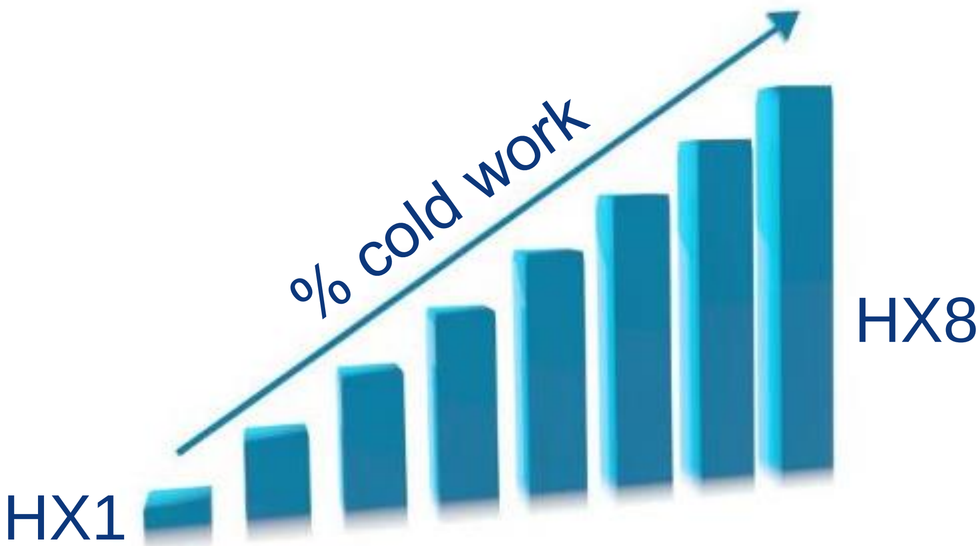


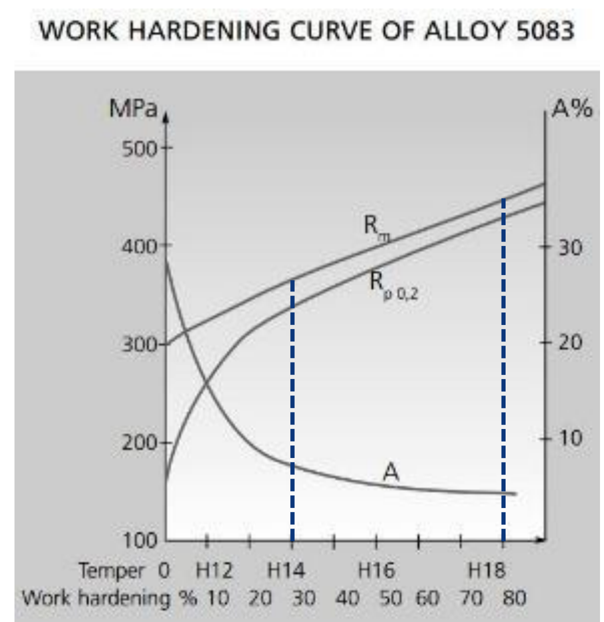
Portion of Al – Cu phase diagram

Source: ASM aluminium and aluminium alloys handbook

Wrought aluminum alloys: temper states

- **H, strain hardened:** non-heat-treatable wrought alloys that have had their strength increased by strain hardening. H is always followed by two or more digits:
  - The first number after the H tells whether the strain-hardened alloy has been thermally treated
  - The second number indicates the approximate amount of cold work





Source: Aluminium in Commercial Vehicle – European Aluminium Association – 2011

Wrought aluminum alloys: temper states

- **H, strain hardened:** non-heat-treatable wrought alloys that have had their strength increased by strain hardening. H is always followed by two or more digits:
  - The first number after the H tells whether the strain-hardened alloy has been thermally treated
  - The second number indicates the approximate amount of cold work
  - Any subsequent numbers define special practices, variations of the normal indicated by the first two numbers.

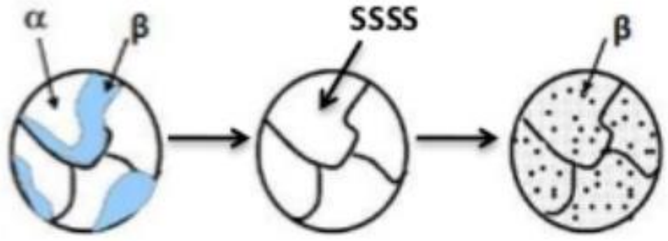
Example:
AA 5083 H116 (marine grade)

Wrought aluminum alloys: temper states

- **T, thermally treated to produce stable tempers:** heat-treatable wrought alloys that have followed a solution heat treatment followed by a quench and either natural or artificial aging.

Heat treatment to increase the strength of Al alloys is a three step process:

1. Solution heat treatment: dissolution of soluble phases
2. Quenching: development of supersaturation
3. Age hardening: precipitation of finely dispersed precipitates



Wrought aluminum alloys: temper states

- **T, thermally treated to produce stable tempers:** heat-treatable wrought alloys that have followed a solution heat treatment followed by a quench and either natural or artificial aging. T is always followed by one or more digits:
  - The first digit after the T can be any from 1 to 10. It is a combination of:
    - Cooled from elevated temperature or solution heat treatment
    - Cold worked or not cold worked
    - Naturally aging or artificial ageing

Table 2 — Summary of processing for achieving T tempers

Ageing	Cold worked	Cooled from shaping process	Furnace solution heat-treated[a]
Natural	No	T1	T4
	Yes	T2	T3
artificial	No	T5	T6, T7
	Yes - before ageing	T10	T8
	Yes - after ageing	-	T9

Wrought aluminum alloys: temper states

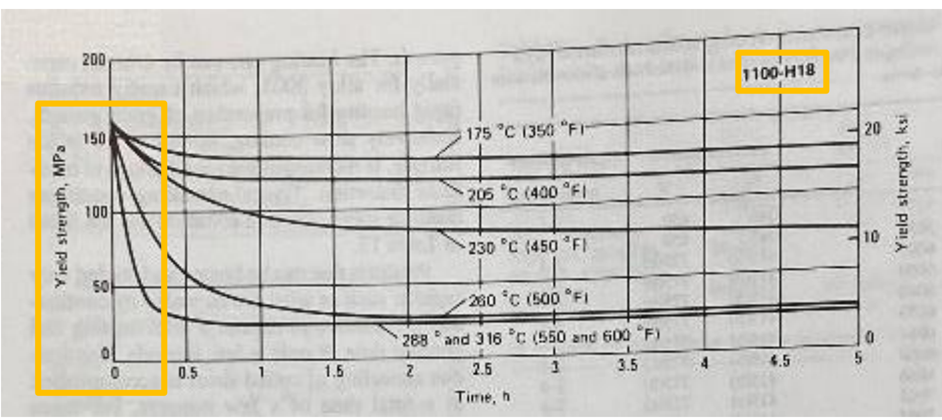
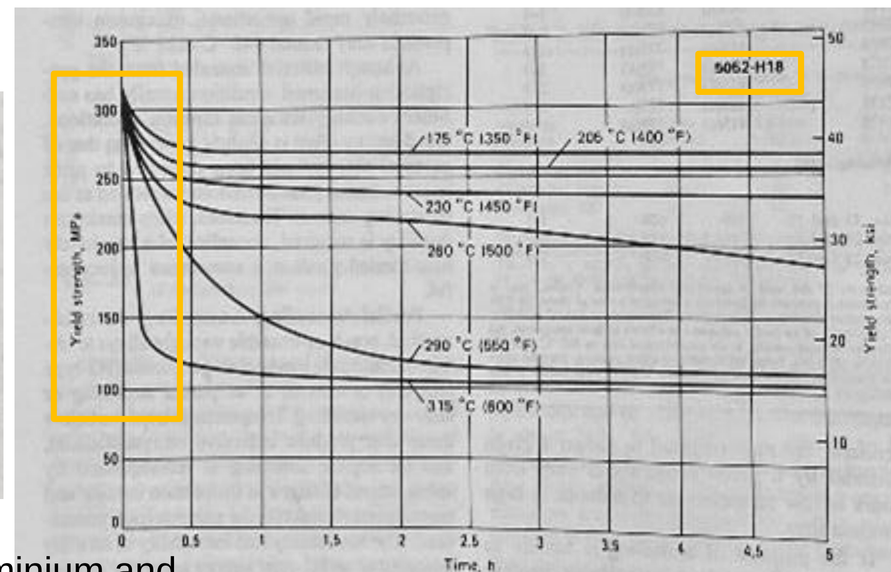
- **T, thermally treated to produce stable tempers:** heat-treatable wrought alloys that have followed a solution heat treatment followed by a quench and either natural or artificial aging. T is always followed by one or more digits:
  - The first digit after the T can be any from 1 to 10. It is a combination of:
    - Cooled from elevated temperature or solution heat treatment
    - Cold worked or not cold worked
    - Naturally aging or artificial ageing
  - Additional numbers indicate a variation in treatment that significantly alters the product characteristics that are or would be obtained using the basic treatment. There is not a full list of all such possible variations.

Wrought aluminum alloys: weldability

- Most non – heat treatable alloys plus series 6xxx can be fusion welded, and precaution should be taken with heat treatable high strength alloys.
  - When non – heat treatable alloys are welded, they loose the effect of an eventual work hardening → softening of HAZ.





Source: ASM aluminium and aluminium alloys handbook

Wrought aluminum alloys: weldability

- Most non – heat treatable alloys plus series 6xxx can be fusion welded, and precaution should be taken with heat treatable high strength alloys.
  - When welding heat – treatable alloys → redistribution of hardening constituents → softening of HAZ. Attention to liquation cracking.

26.02.2015

Technical Specification

N° 2001 - Ed. 8
EDMS No: 790779

Oxygen-Free Electronic copper
Bars/blanks/ingots

Cu-OFE

This document specifies the CERN technical requirements for Cu-OFE bars/blanks/ingots, equivalent to UNS C10100 Grade 1, according to ASTM B224 with a maximum oxygen content of 5 ppm.

Original : English

2.2. CHEMICAL COMPOSITION

The composition shall conform to the requirements of the UNS C10100 Grade 1 according to the standard ASTM B170.

O_2	0.0005% in mass max.

2.3. HYDROGEN EMBRITTLEMENT

According to ASTM B170 and F68, the material shall be free from hydrogen embrittlement.

Weldability / brazeability

2.6. MECHANICAL PROPERTIES

In accordance with the size, the products shall be given the necessary treatment to allow delivery as close as possible to the quarter-hard state, according to ASTM B152 and the required mechanical properties given in the following table.
Tensile testing shall be carried in accordance with ISO 6892-1. Tensile testing must be performed both longitudinal and transverse direction.
At room temperature:

Tensile strength	R_m		240-280* N/mm²
Yield stress	$R_{p0.2\%}$		200-240* N/mm²
Elongation at break	A_5	min.	25*%
Brinell hardness 20 kgf (2 mm ball)	HBS	min.	60*

*Any value out of these ranges shall be agreed between CERN and manufacturer prior to delivery.

Ease of machining

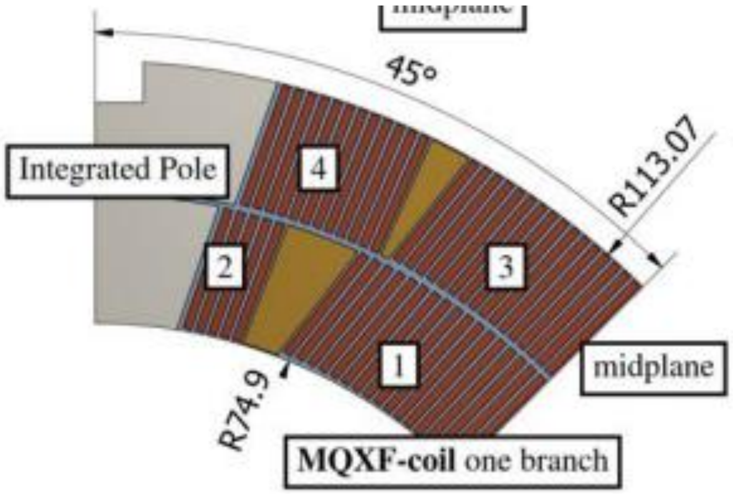
Non – ferrous materials

- Titanium
  - The name comes from Titan, son of Gaea.
  - High corrosion resistance, low density, high mechanical resistance.

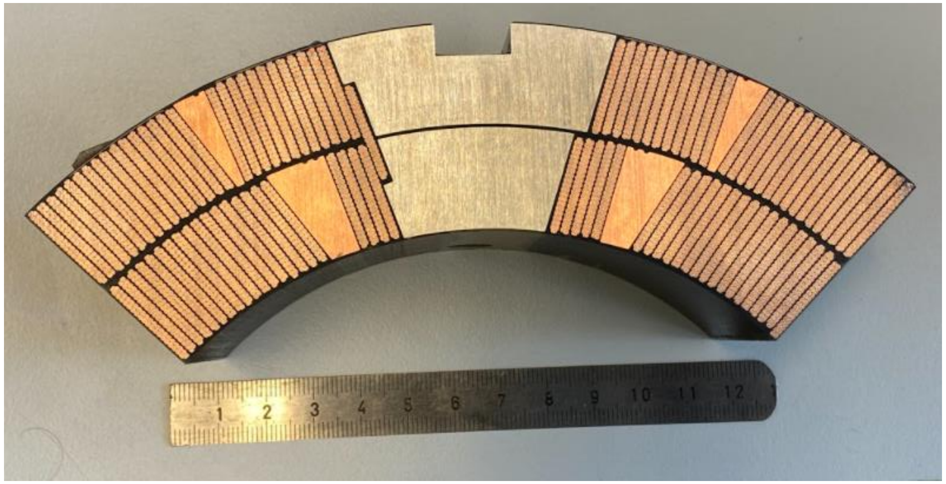
If price is not a problem,
Ti overwhelms Al in many
aspects

Titanium in particle accelerators

- High specific strength.
- Paramagnetic
- Lower thermal expansion / contraction than stainless steel



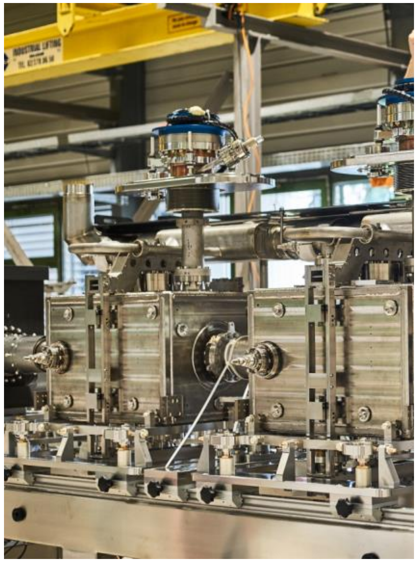
Courtesy: C. Loffler

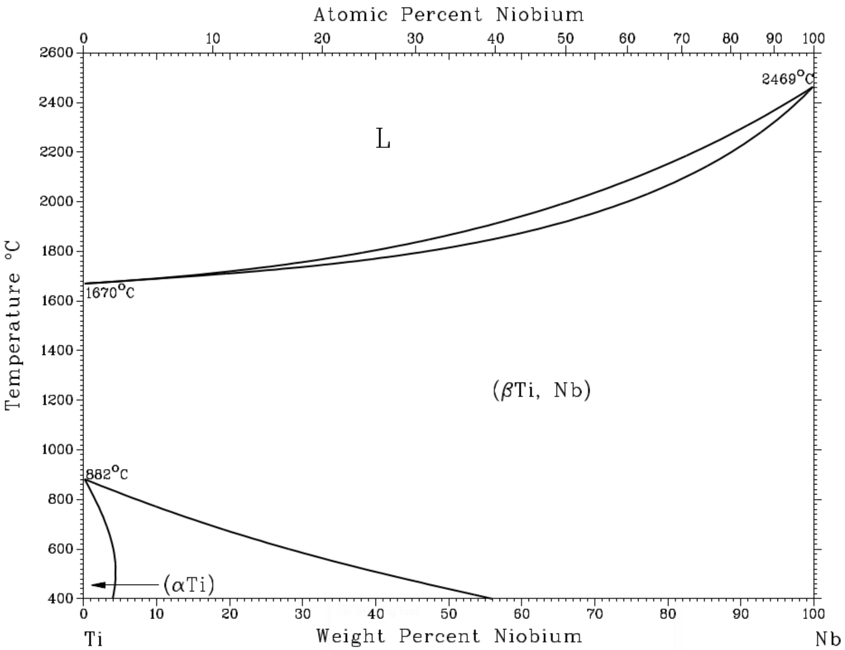


Cross section MQXF. Ti pole

Titanium in particle accelerators

- Certain grades are ductile and moderately tough at cryogenic temperature.
- Thermal contraction close to Nb than stainless steel.
- Weldable with Nb (total solubility)

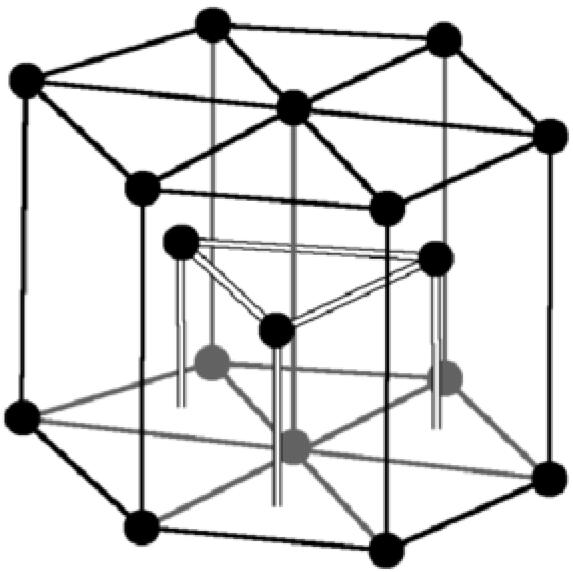




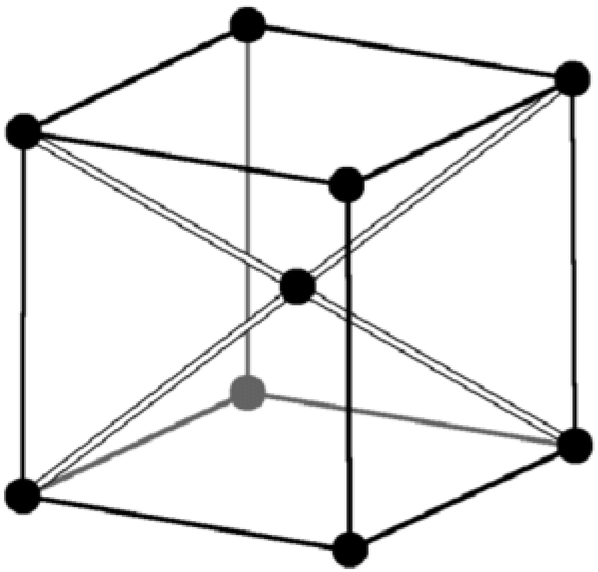
Titanium (II) He tanks of the crab cavities for HL - LHC

Titanium grades

- Microstructures of Ti



α Ti – hexagonal closed packed (HCP)



β Ti – body centred cubic (BCC)

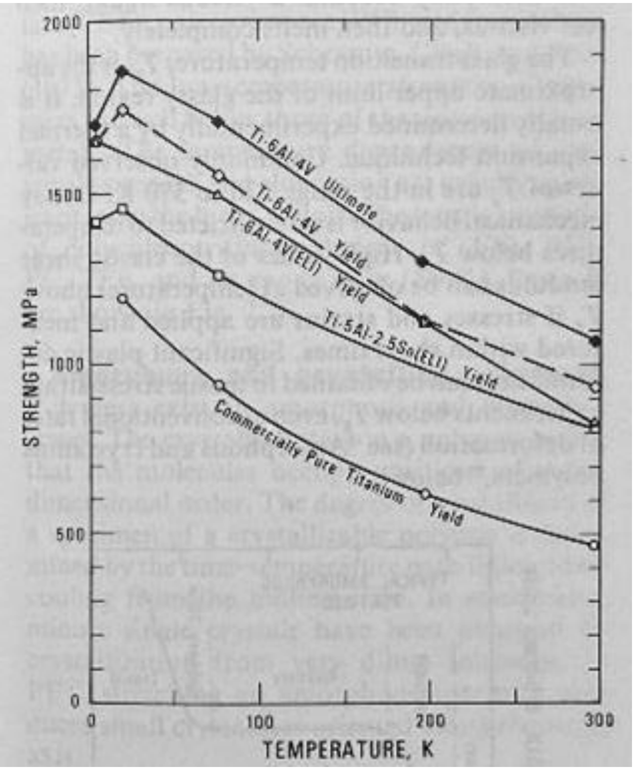
We privilege compact structures (**α – Ti**) for cryogenic application

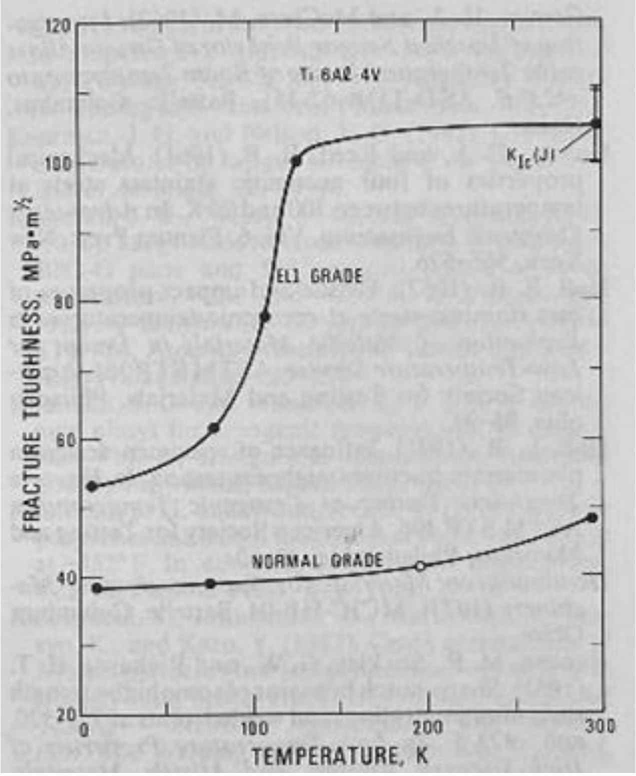
Titanium grades

- Extra – low interstitials (ELI)

At any rate pure titanium was finally produced. But it was only by stretching the point considerably that this metal could be accepted as pure, for it still contained several tenths of a per cent of impurities. Only several tenths, but they were like a fly in the ointment. The impurities made titanium fragile and brittle and unsuitable for machining. It earned a bad fame for being a useless, good-for-nothing metal.

In 1925, the Dutch scientists van Arkel and de Boer decomposed titanium tetrachloride on a heated tungsten wire and obtained high-purity titanium. And then it became clear that Hunter's assertion concerning the brittleness of titanium could not stand up to criticism: the metal produced by van Arkel and de Boer was highly plastic, could be forged like iron and rolled into sheets, strip, wire and even the thinnest foil.





We privilege ELI grades for cryogenic application

Non – ferrous materials

- Niobium
  - Element of the periodic system with the highest critical temperature.
  - The name comes from Niobe, the daughter of Tantalus:

But the Greek queen

Not the one in the movie ‘The Matrix’

Non – ferrous materials

- Niobium
  - Element of the periodic system with the highest critical temperature.
  - The name comes from Niobe, the daughter of Tantalus:
    - Nb is found in combination with Ta (Coltan)
    - You can still find it in old texts by Cb (columbium)

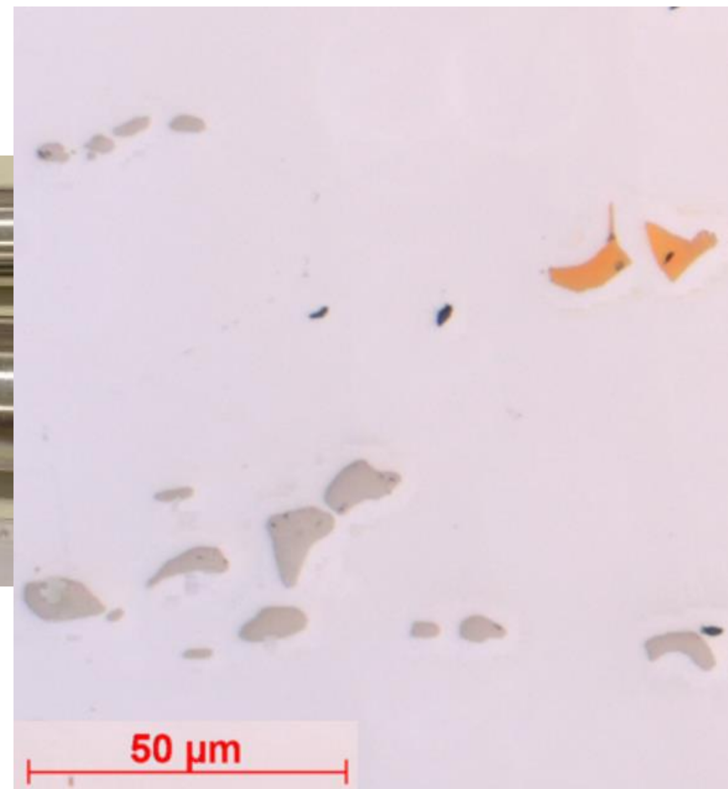
Families of non – ferrous materials

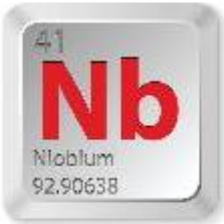
- Niobium
  - 90 % of its production is used to alloy stabilized steel grades or high temperature superalloys.

Inconel 718 for ITER magnet supports.



Nb, Ti carbides and nitrides in dark grey and yellow respectively. Inconel 718 for ITER magnet supports.

Non – ferrous materials



- Niobium
  - 90 % of its production is used to alloy stabilized steel grades or high temperature superalloys.
  - Superconducting wires for high field magnets (NbTi, Nb_3Sn).

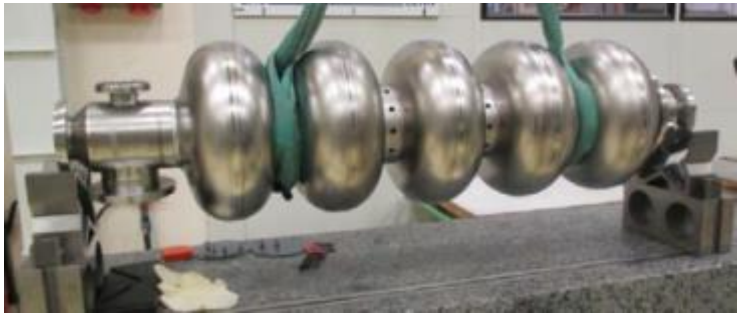
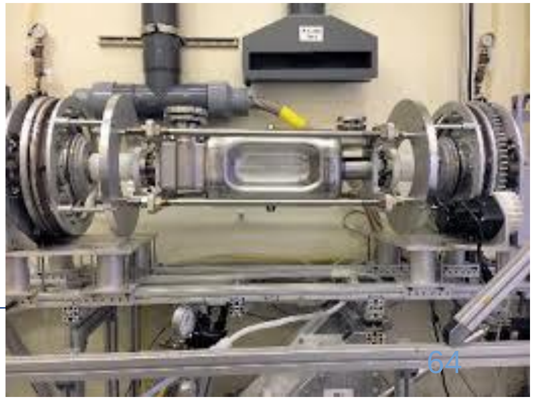
  - Ultrahigh purity Nb

DQW crab cavity



5 cell elliptical cavity

RFD crab cavity



Niobium for SCRF cavities

- High critical temperature (9.2 K)
- High critical magnetic field
- High formability, ‘easy’ to machine and weldable.
- Available in practically any size

Niobium grades

- ASTM B392 & B393

Designation: B393 – 18

Standard Specification for
Niobium and Niobium Alloy Strip, Sheet, and Plate[1]

1. Scope

1.1 This specification covers five grades of wrought niobium and niobium alloy strip, sheet, and plate as follows:

1.1.1 *R04200-Type 1*—Reactor grade unalloyed niobium,

1.1.2 *R04210-Type 2*—Commercial grade unalloyed niobium,

1.1.3 *R04251-Type 3*—Reactor grade niobium alloy containing 1 % zirconium,

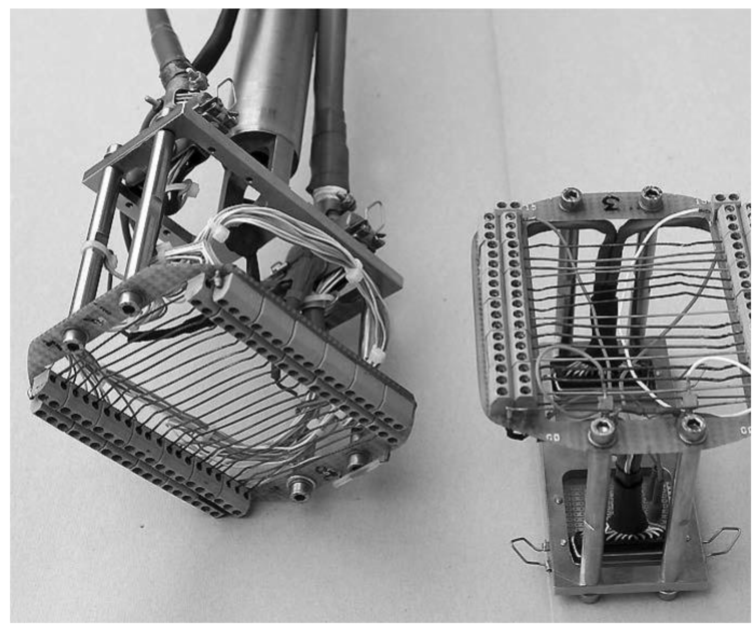
1.1.4 *R04261-Type 4*—Commercial grade niobium alloy containing 1 % zirconium, and.

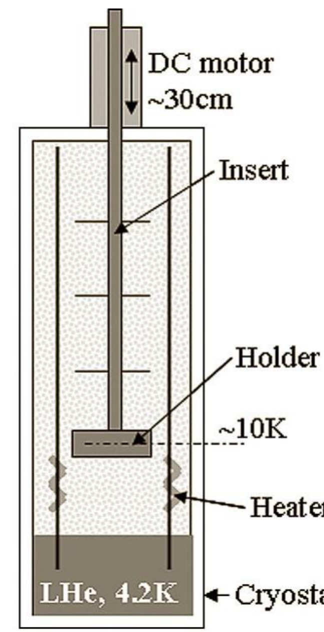
1.1.5 *R04220-Type 5*—RRR grade pure niobium.

Designation: B392 – 18

Standard Specification for
Niobium and Niobium Alloy Bar, Rod, and Wire[1]

RRR = residual resistivity ratio
An accurate measurement of the purity above 99.999%





Niobium grades & SCRF

- CERN technical specification
  - Equilibrium between:
    - RF performance
    - Mechanical robustness
    - Material soundness

NDT of Nb technical specification

Visual inspection	EN 13018	On final product after all metallurgical processing for every item, 100%
Dye penetrant (optional)	Written procedure, based on EN 10228-2, following approval by CERN	Upon demand by CERN; on final product after all metallurgical processing for every item, 100%
Macro-/ micro-optical	Specimen preparation: ASTM E3 Macro-etching: ASTM E340 Micro-etching: ASTM E407	Upon demand by CERN; on witness sample of final product after all metallurgical processing for every item.
Ultrasonic	Written procedure based on: -EN 10228-4 for the method -EN 4050-4 for acceptance criteria Following approval by CERN	On final product after all metallurgical processing for every item, 100%

Materi

Conclusions

- The golden rule to be remembered:
  - "A material for an accelerator part is not a mere chemical composition or designation":
    - Specification. Fabrication route. Temper state
    - Controls
    - Price
  - Attention to less known properties (e.g. notch sensitivity)

- The very particular environment of particle accelerators, limits the choice.

- Time (and problems) are saved if material selection is integrated from the beginning of the conceptions.
  - Advanced non conventional materials require imply extensive prior R&D

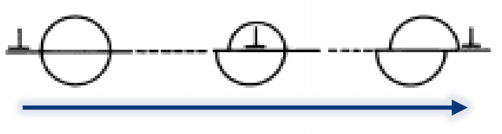
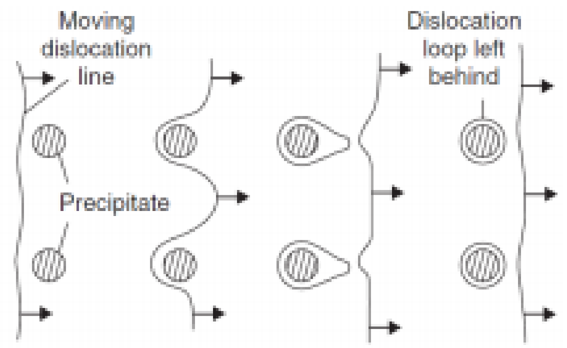
Precipitation strengthening

- Dislocations are the carriers of plastic deformation
- Precipitates hinder dislocation motion. There are 2 types: coherent and incoherent



A dislocation cuts through a coherent particle, i.e. it passes through the precipitate on the same slip plane as in the matrix



Dislocation bows out between incoherent precipitates

A loop is left around each particle

Prices

Aluminium and alloys

- Al and Al alloys general purpose → 5 EUR / Kg
- EN AW 2219 forged blanks → 80 EUR / Kg
- Special forgings, EN AW 6061 → 15 EUR / Kg

Coppers

- OFE Cu → 25 - 40 EUR / Kg (3D forged)
- OF Cu→ 10 EUR / Kg (basis)
- CuBe, high (low) Be → 40 - 90 EUR / Kg (strips)
- Glidcop → 55 EUR / Kg

Titanium

- Grade 2→ 50 EUR / Kg (plates)
- Ti6Al4V (ELI) → 50 (140) EUR / Kg

Niobium

- Nb (RRR 300) → 600 EUR / Kg
