Exploitation of LHC and Future Circular Colliders

Frédérick Bordry

Basics of Accelerator Science and Technology at CERN – Chavannes 7th February 2014

Outline

- **LHC recall and 1st Run**
- **LS1 status**

- **Run 2 (from LS1 to LS2)** ⇒ ***13-14 TeV***
- **LS2 and Run 3** ⇒ **300 fb^{-1}**

- **High Luminosity LHC project** ⇒ **3'000 fb^{-1}**

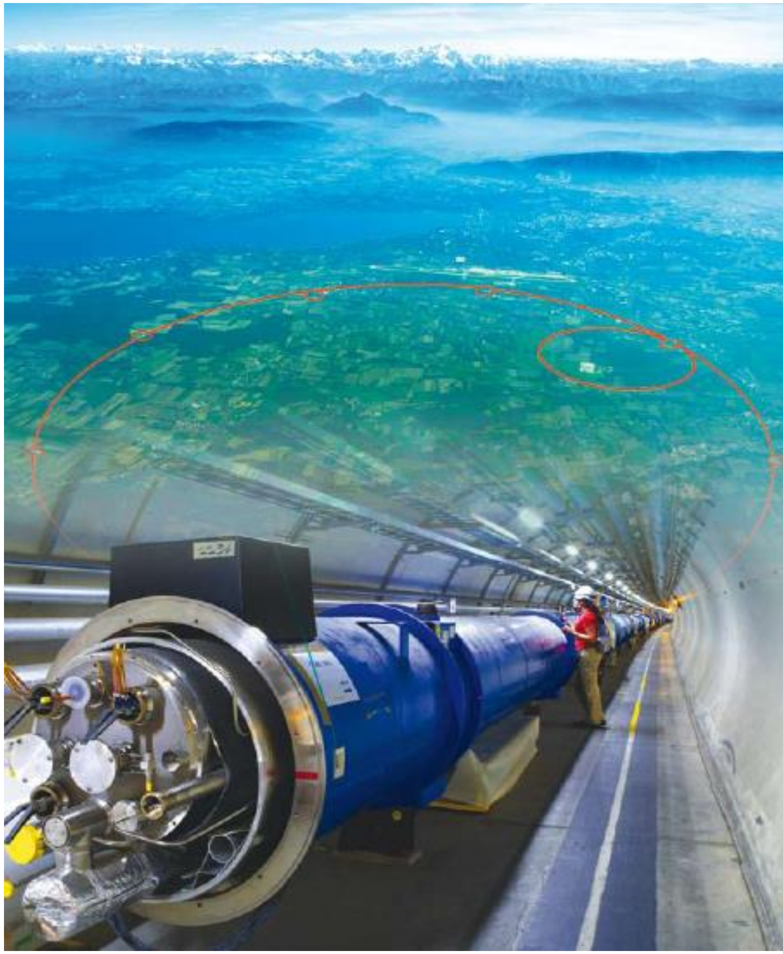
- **Post-LHC machine:**
  - **Future Circular Colliders** ⇒ ***0.25-100 TeV***
  - ***CLIC*** ⇒ ***0.25-3 TeV***

- **Conclusion**

LHC (Large Hadron Collider)

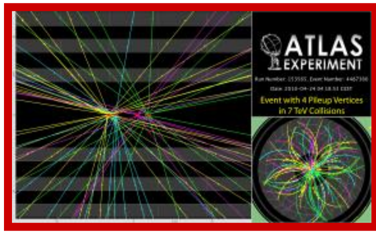
14 TeV proton-proton accelerator-collider built in the LEP tunnel

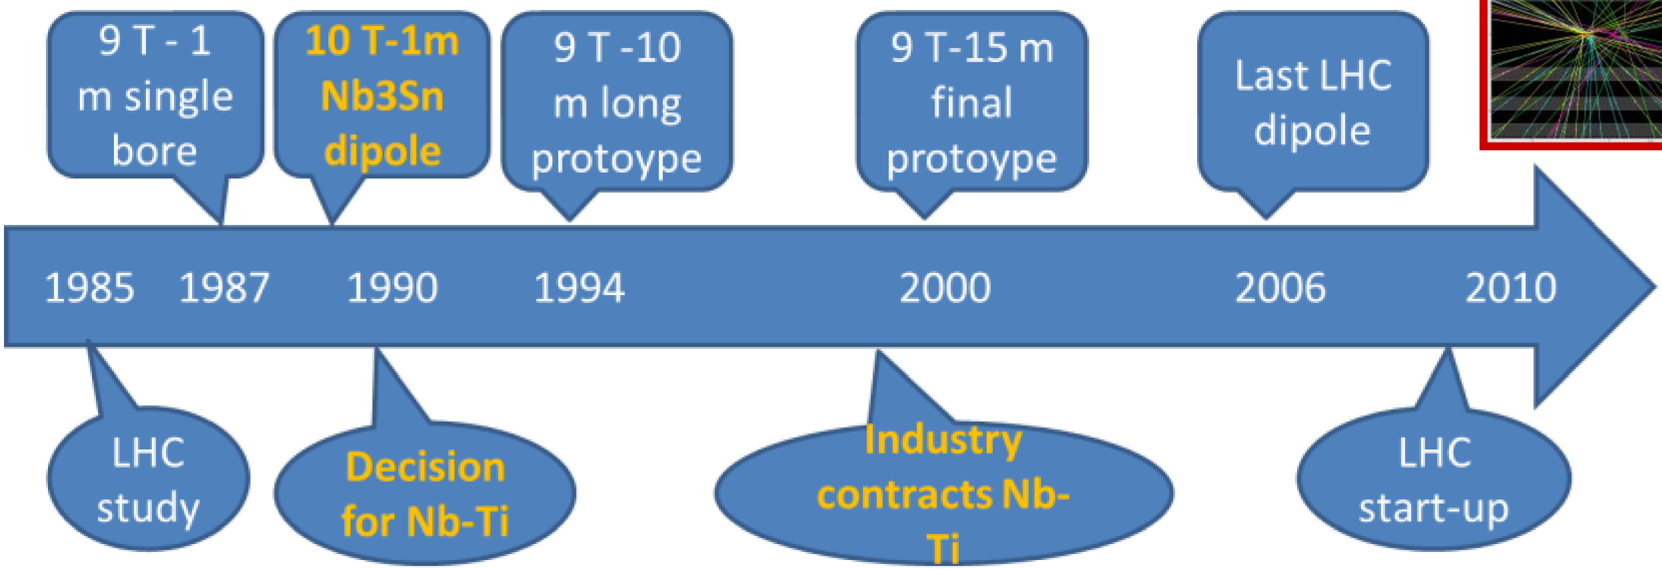
Lead-Lead (Lead-proton) collisions

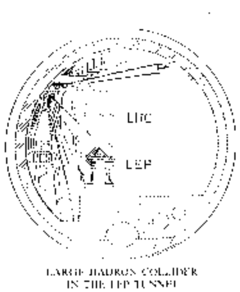


1983 : First studies for the LHC project
1988 : First magnet model (feasibility)
1994 : Approval of the LHC by the CERN Council
1996-1999 : Series production industrialisation
1998 : Declaration of Public Utility & Start of civil engineering
1998-2000: Placement of the main production contracts
2004 : Start of the LHC installation
2005-2007: Magnets Installation in the tunnel
2006-2008: Hardware commissioning
2008-2009: Beam commissioning and repair
2009-2030: Physics exploitation

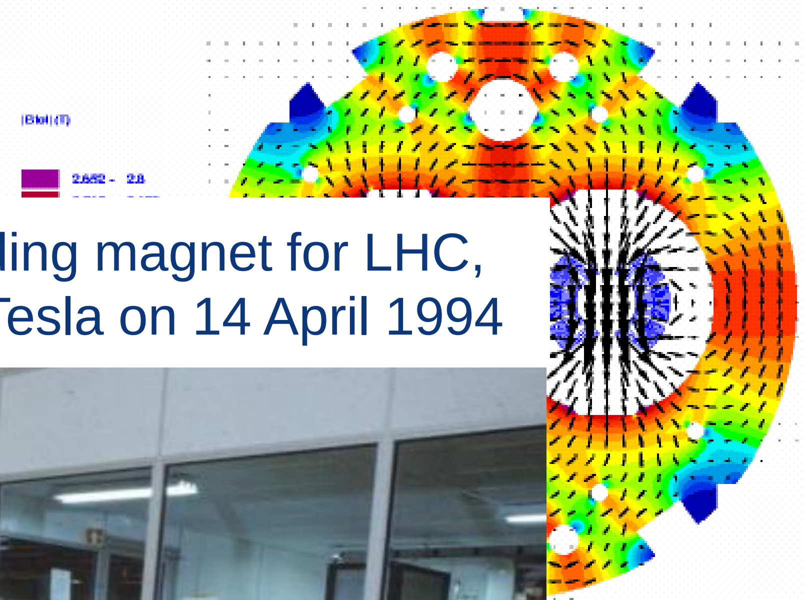
LHC, the construction timeline: Nb-Ti magnet maturation

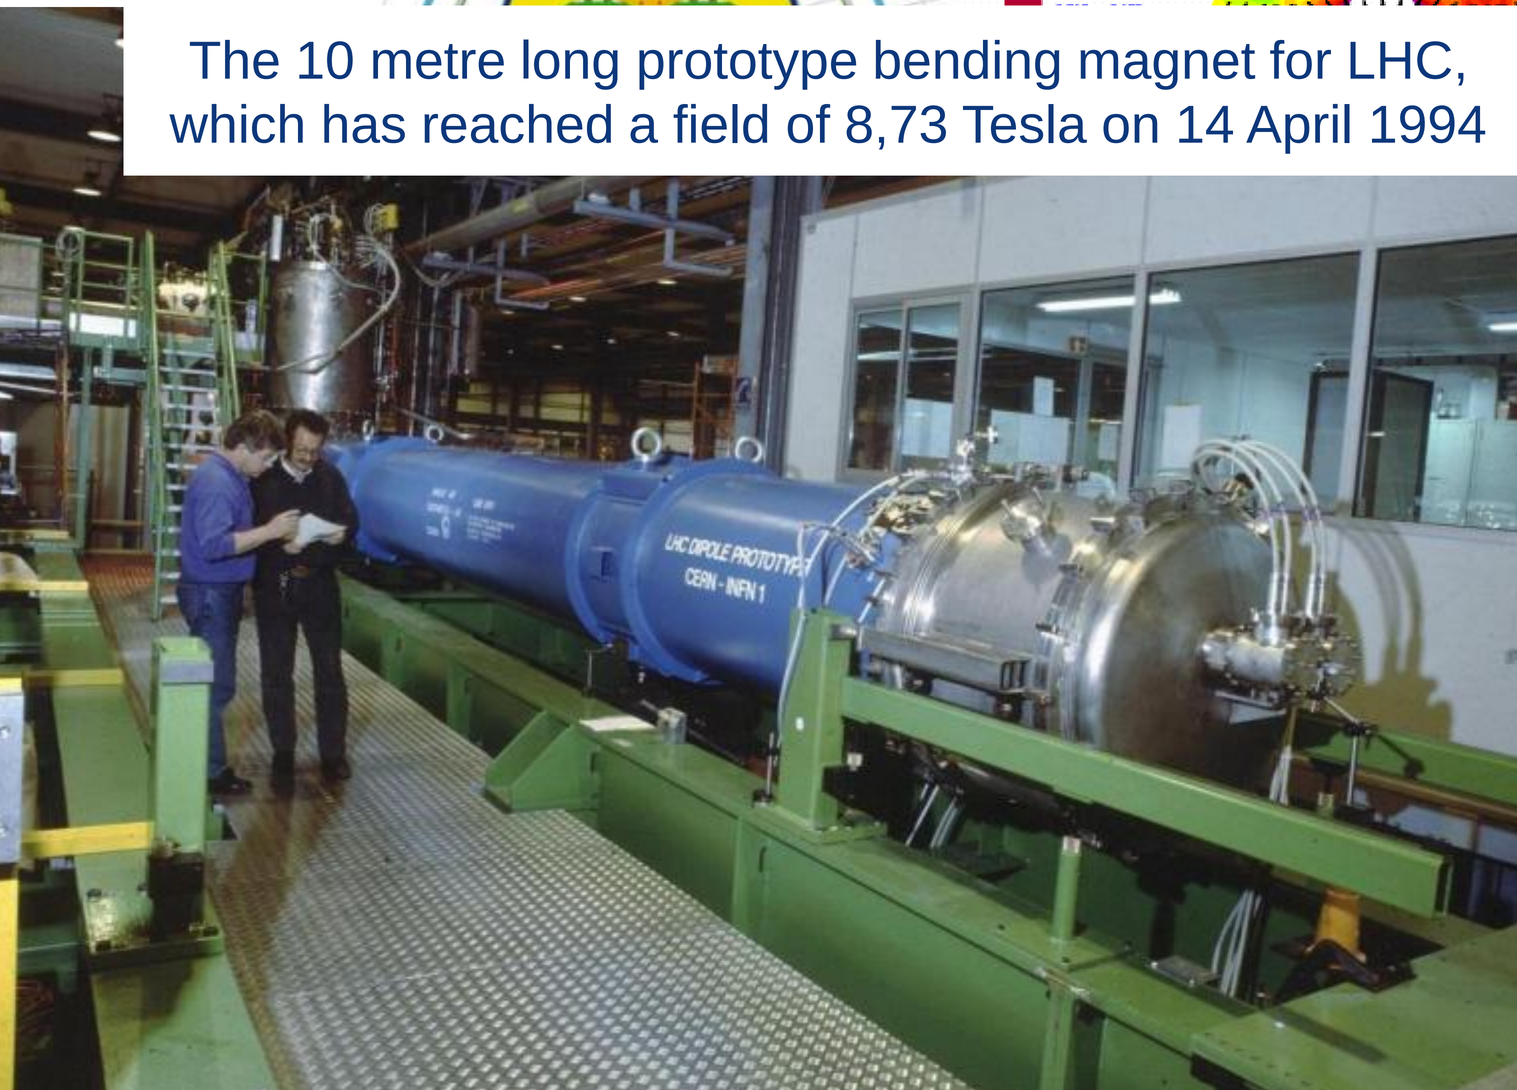


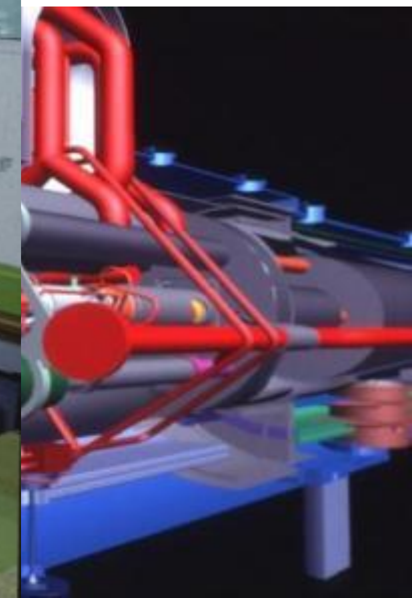




Prototype and industrialisation







The 10 metre long prototype bending magnet for LHC, which has reached a field of 8,73 Tesla on 14 April 1994

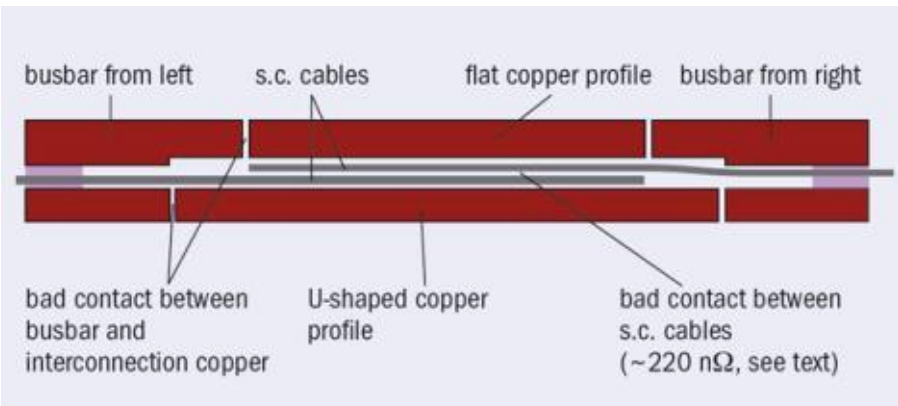
with1.5 10^{11} protons

Long Shutdown 1

LS1 starts as the shutdown to repair the magnet interconnects to allow nominal current in the dipole and lattice quadrupole circuits of the LHC.



or shutdown which, in repairs, maintenance, nd cabling across the x and the associated experimental facilities.

All this in the shadow interconnects.

The main 2013-14 LHC consolidations

Openings: 100 %
1695 Openings and final reclosures of the interconnections

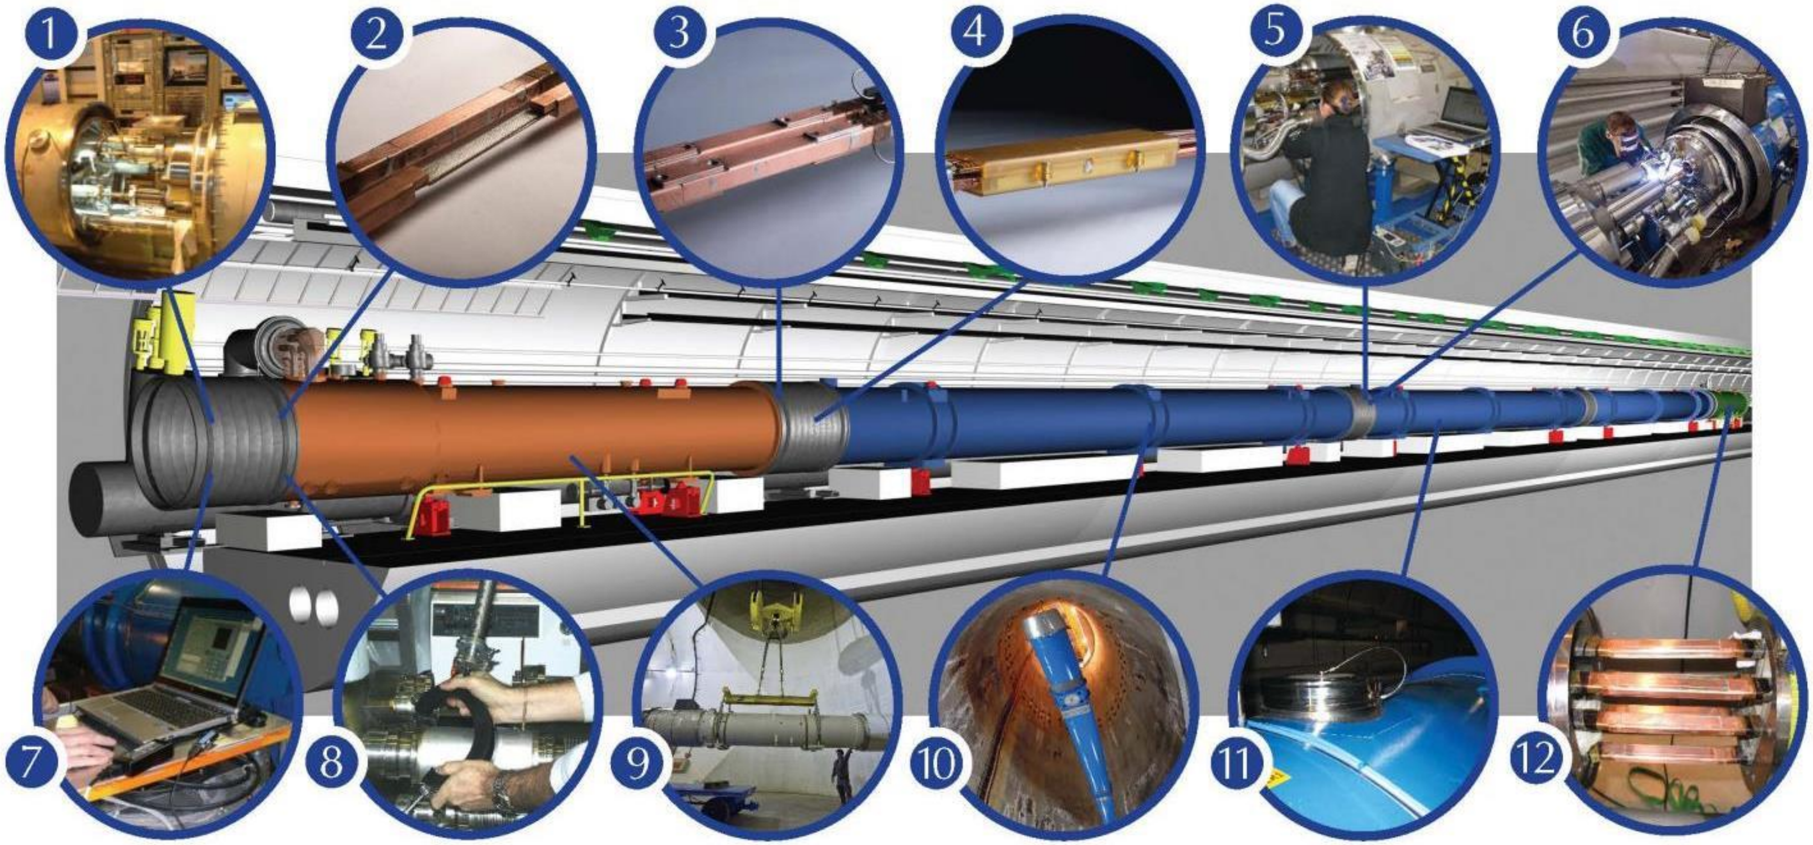
Complete reconstruction of ~~1500~~ 3000 of these splices

80 % done
Consolidation of the 10170 13kA splices, installing 27 000 shunts

70 % done
Installation of 5000 consolidated electrical insulation systems

300 000 electrical resistance measurements

50 % done
10170 orbital welding of stainless steel lines



18 000 electrical Quality Assurance tests

10170 leak tightness tests

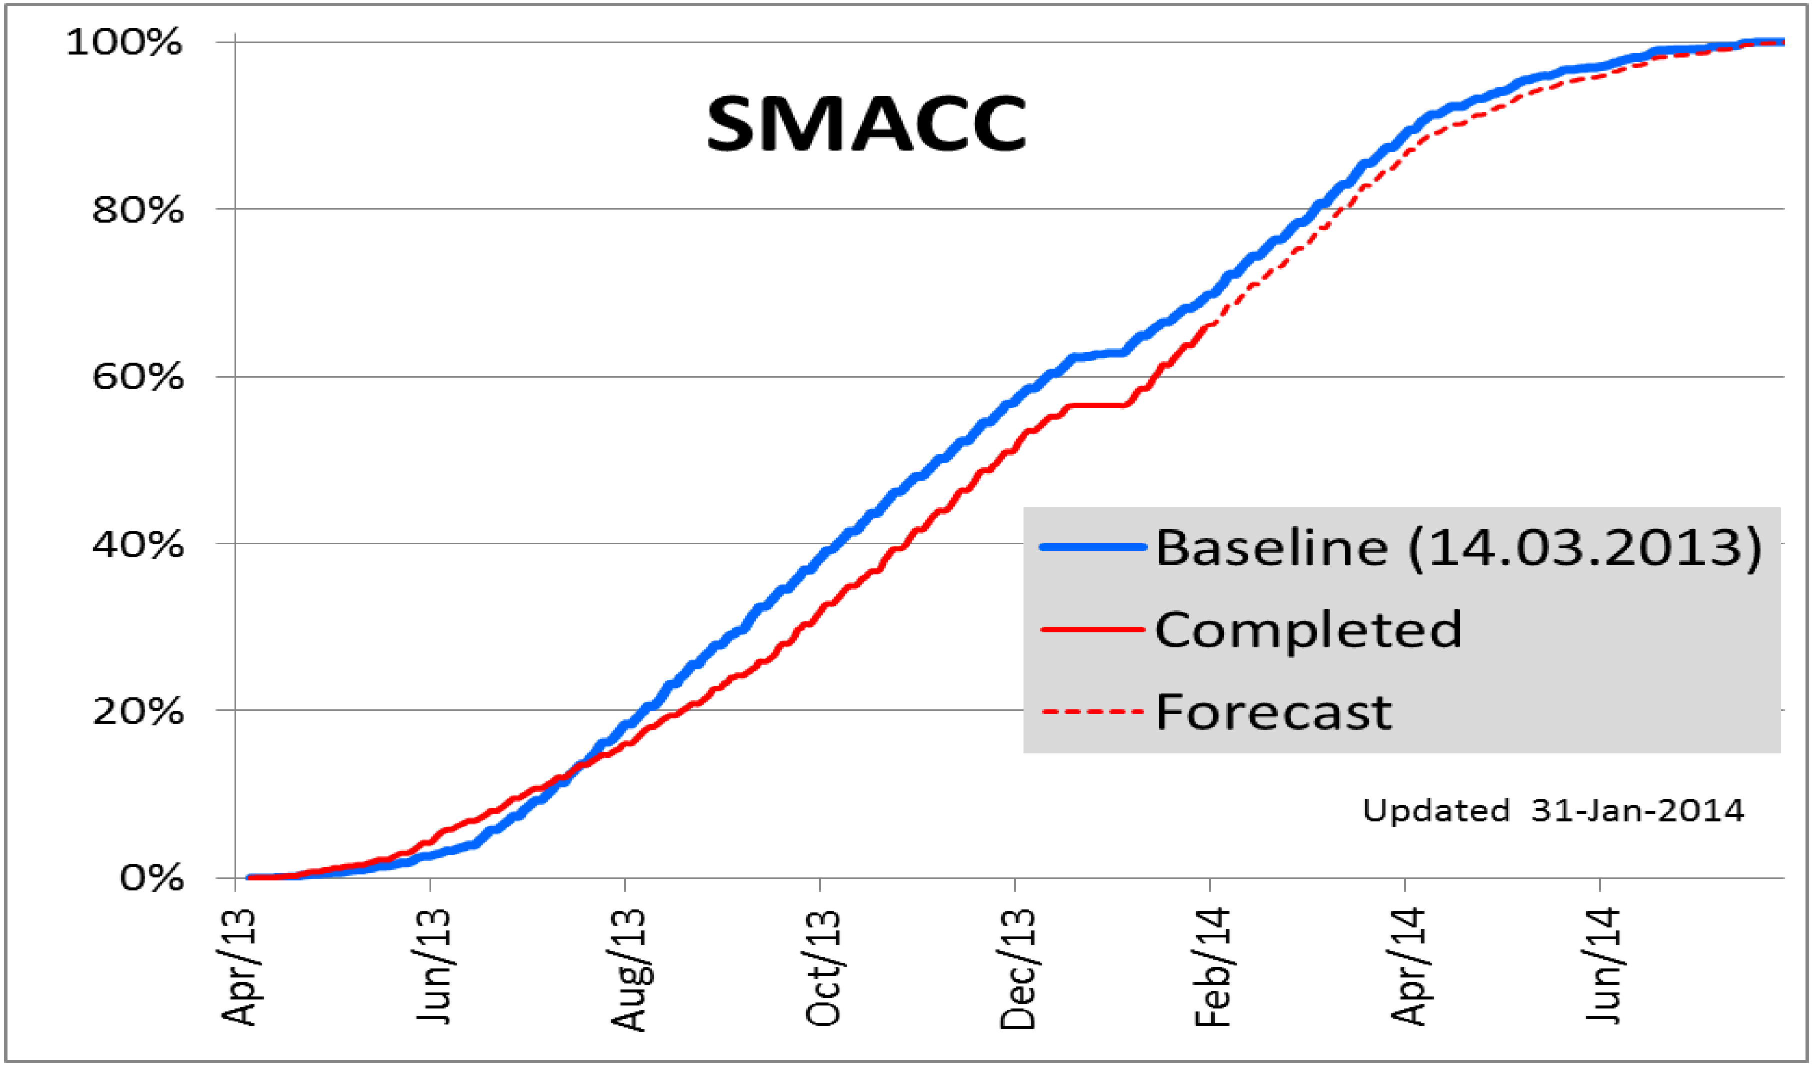
3 quadrupole magnets to be replaced
Done

15 dipole magnets to be replaced
Done

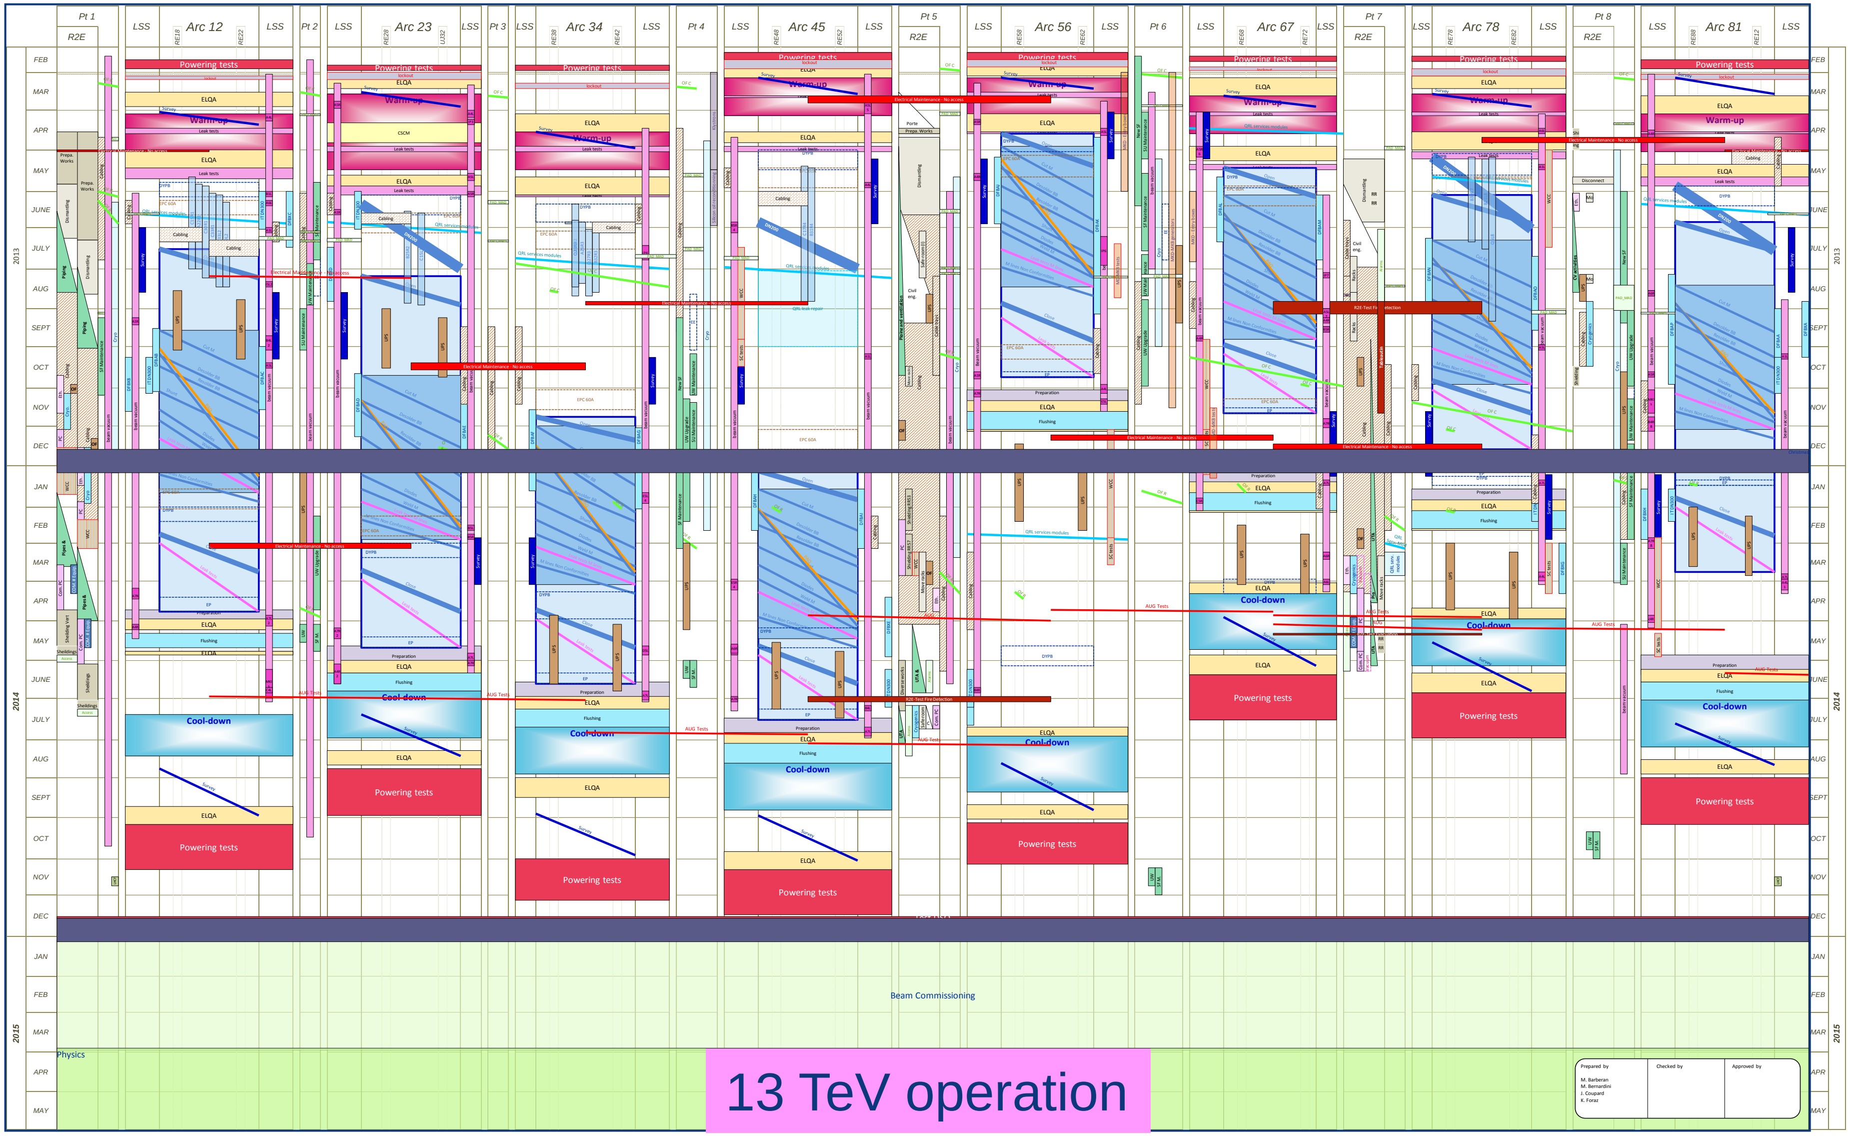
Installation of 612 pressure relief devices to bring the total to 1344
Done

Consolidation of the 13 kA circuits in the 16 main electrical feedboxes

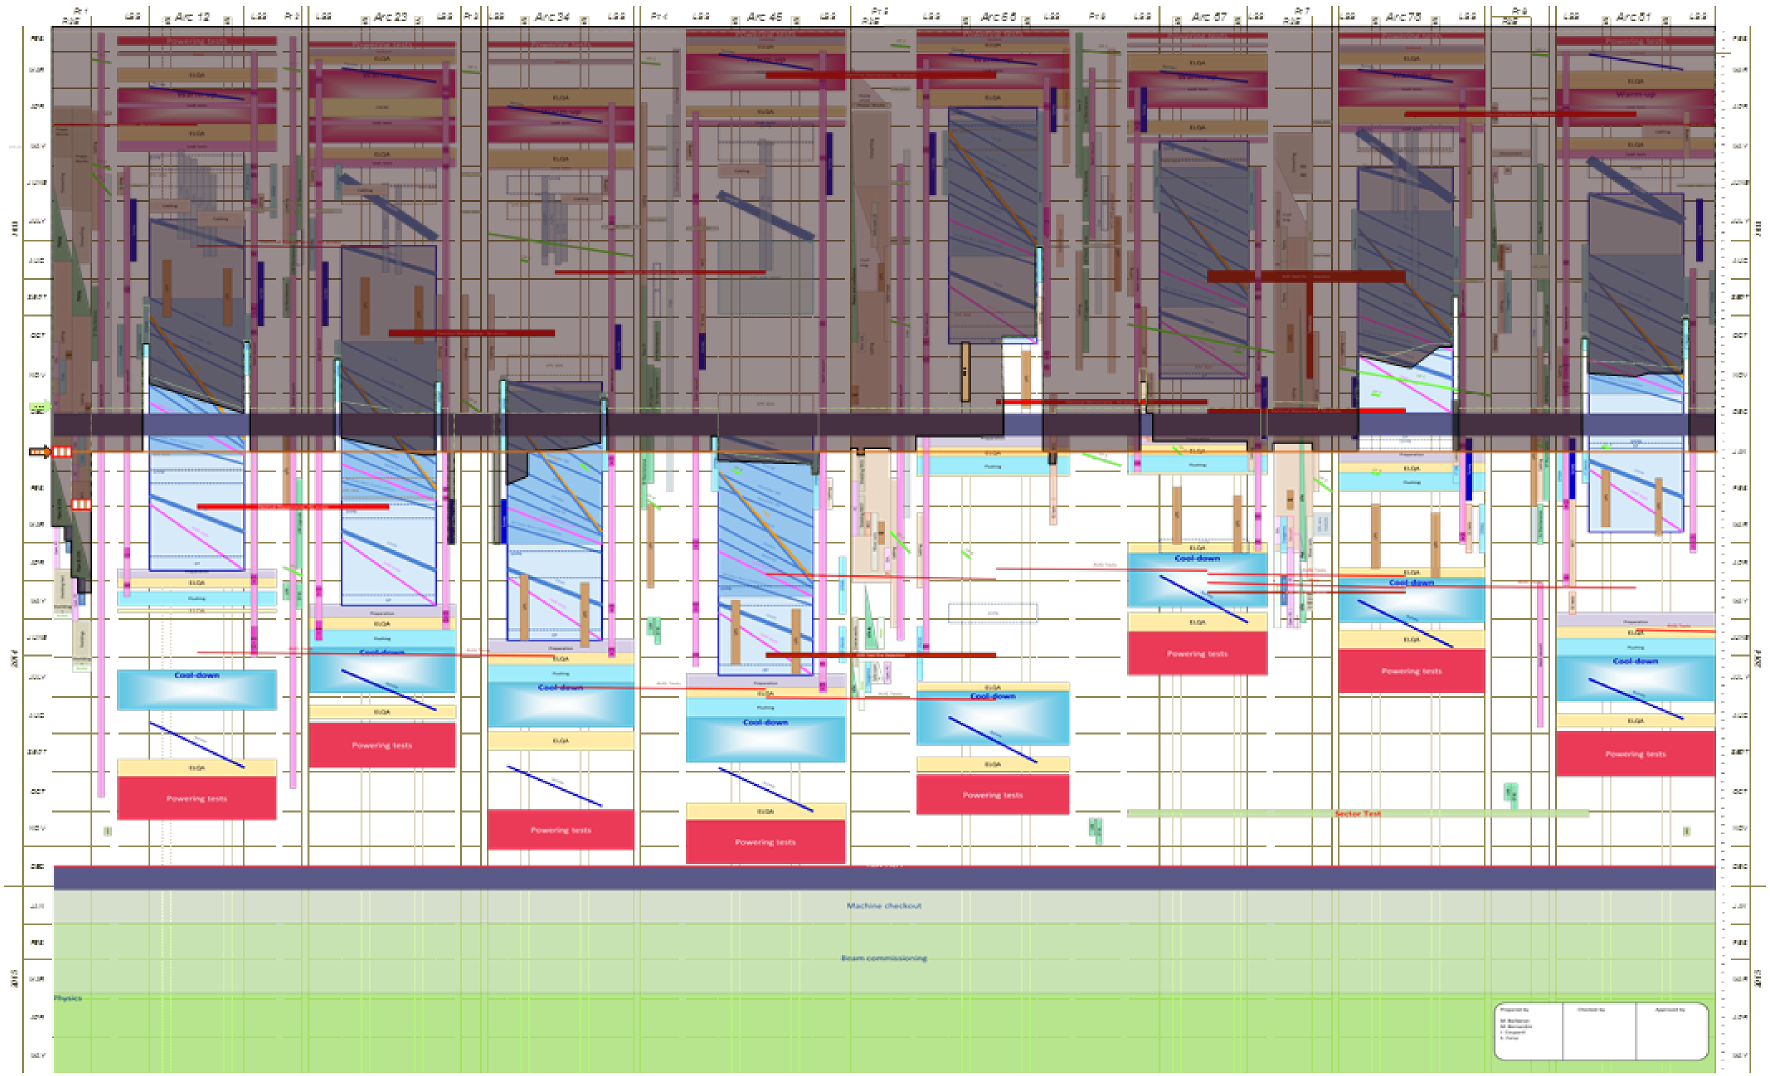
Superconducting Magnets And Circuits Consolidation Dashboards



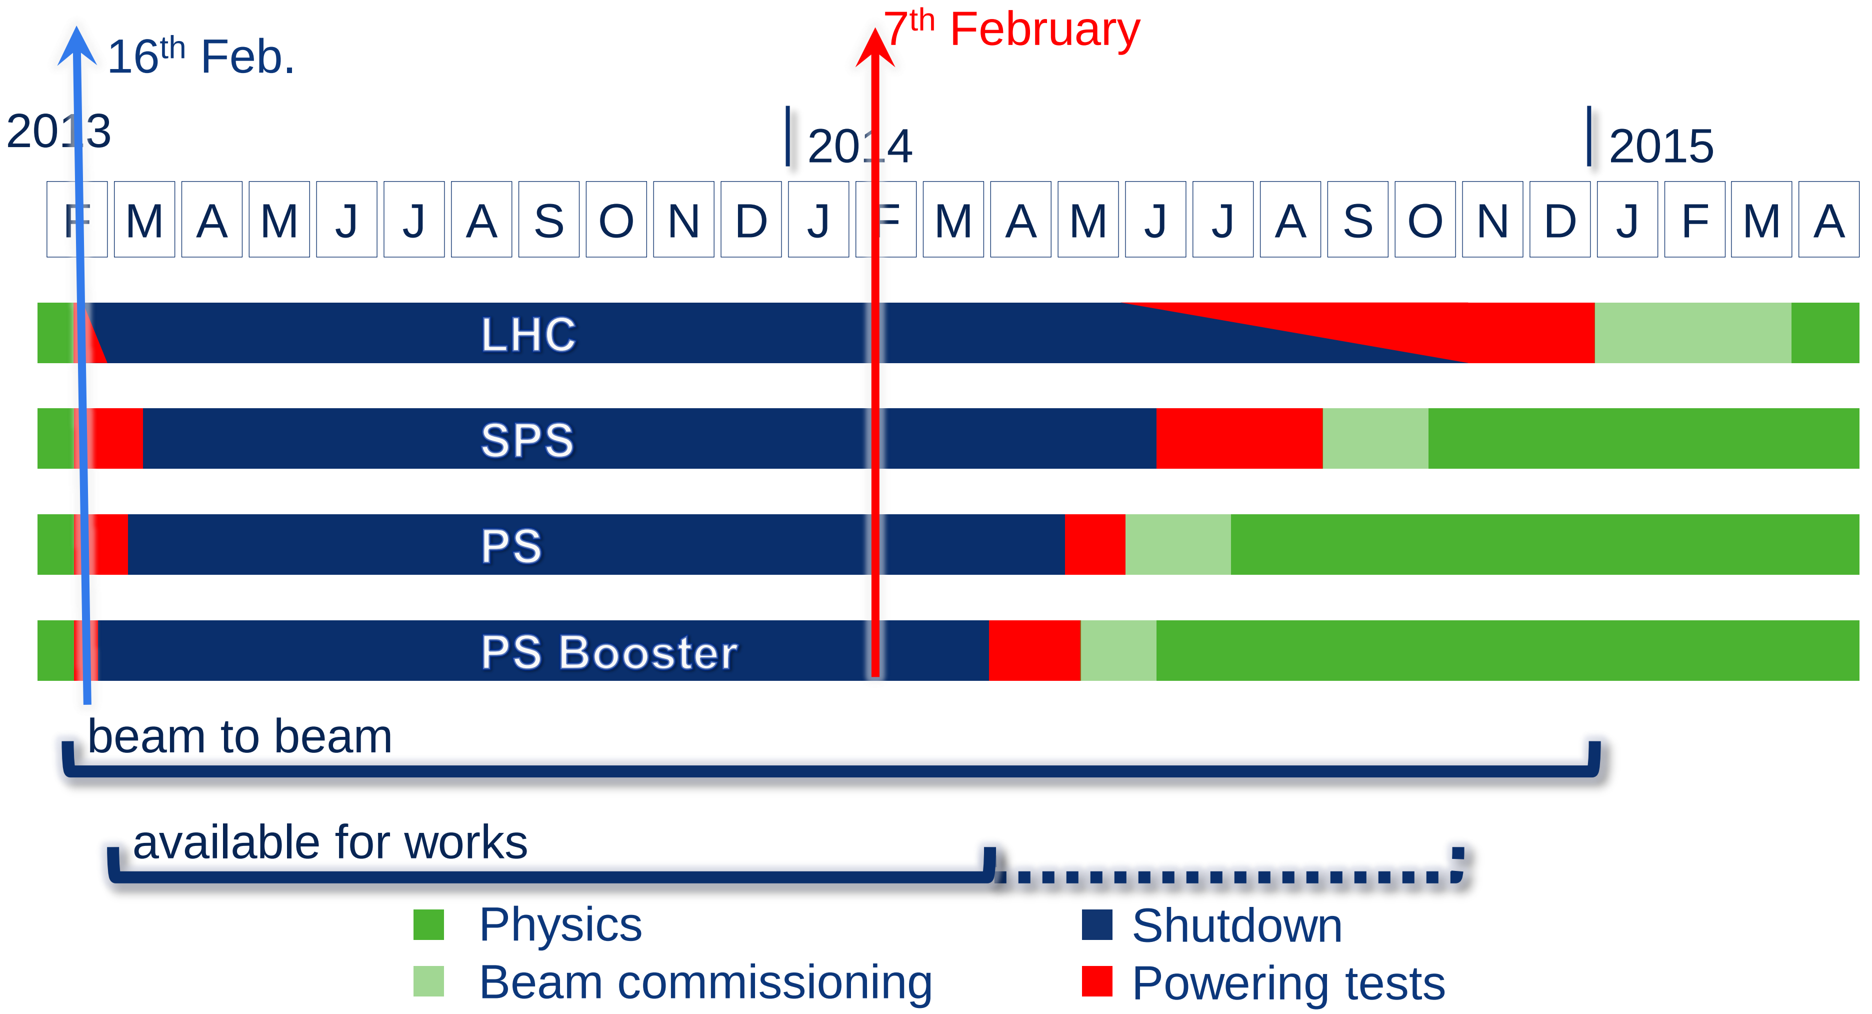
LS1: LHC schedule



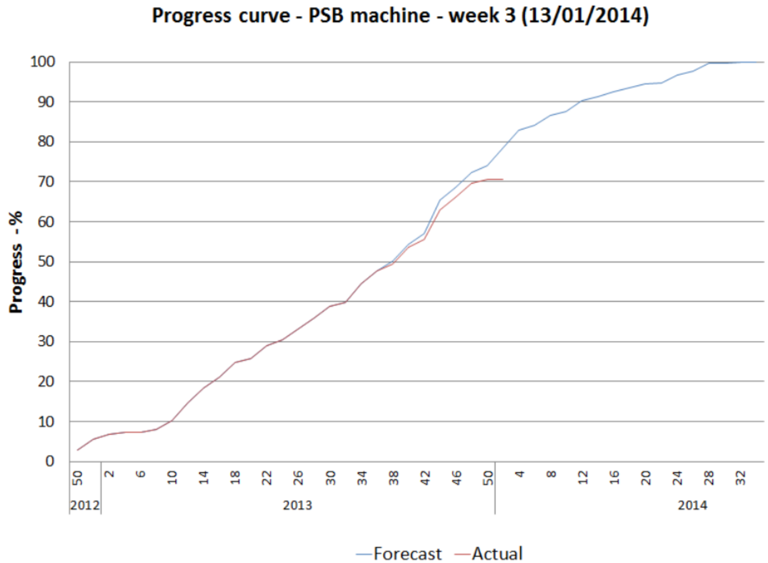
So far, LS1 is on schedule for beams in January 2015 for LHC

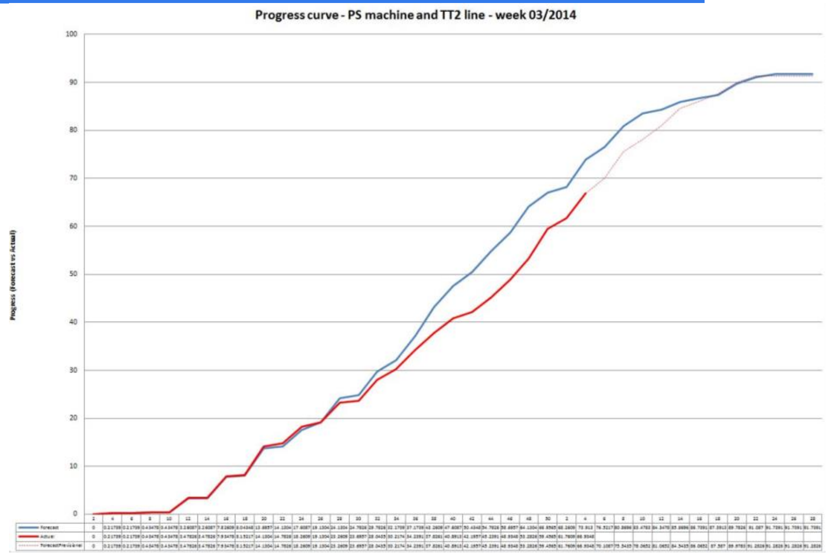


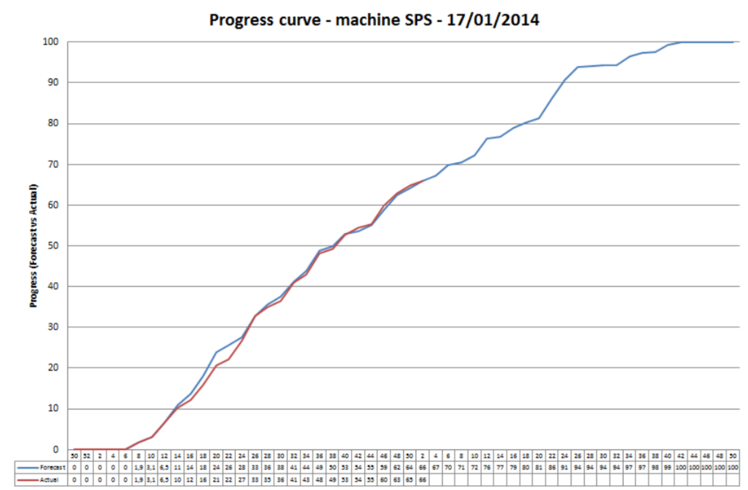
LS 1 from 16th Feb. 2013 to Dec. 2014

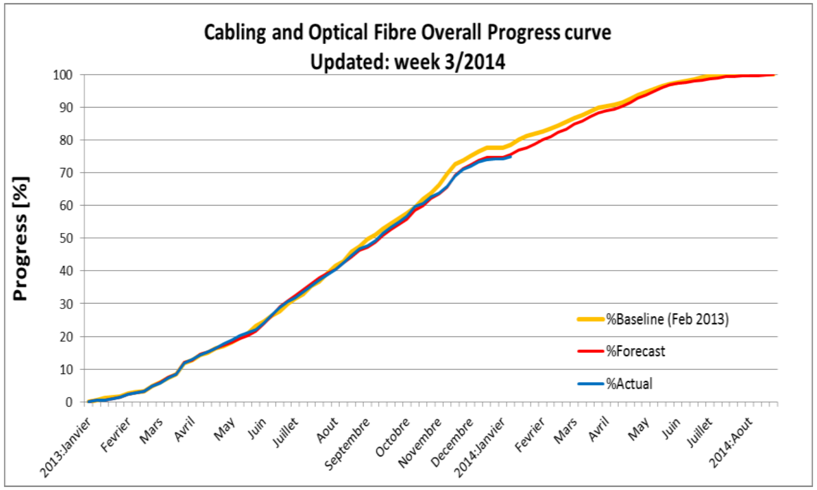


LS1: LHC Injectors status and cable status

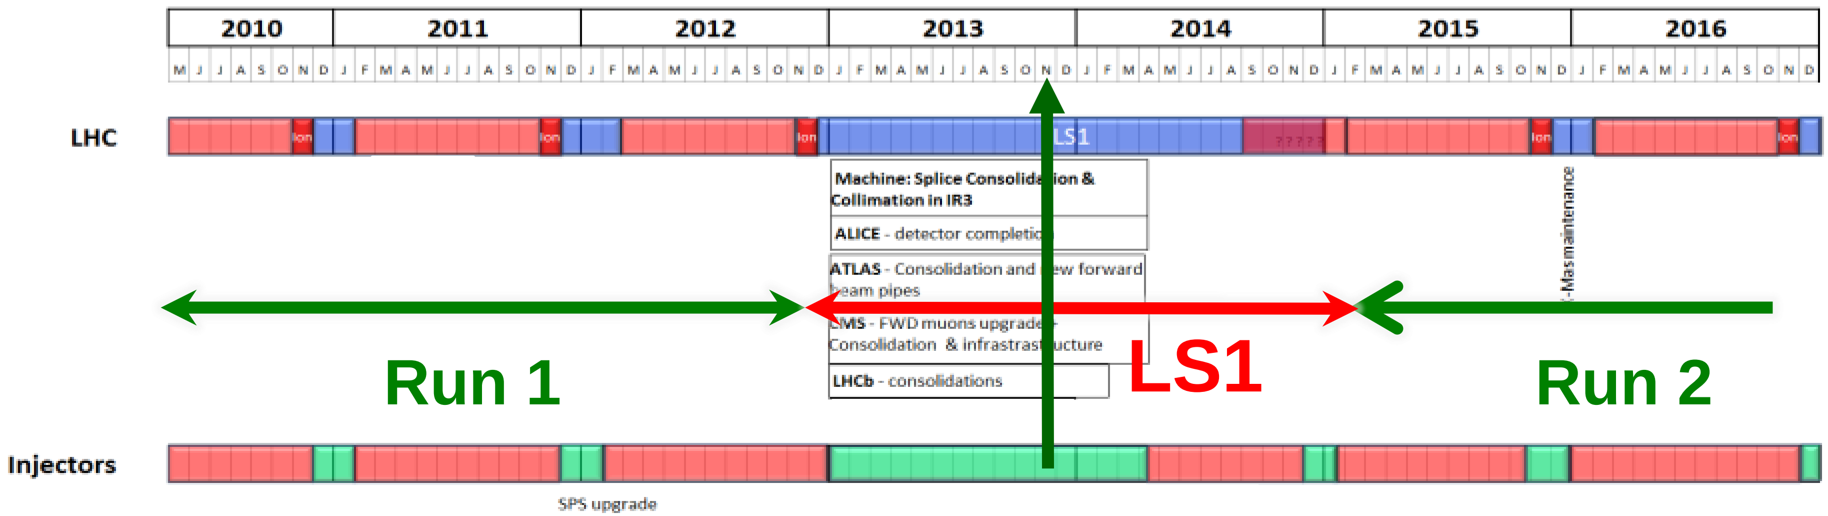


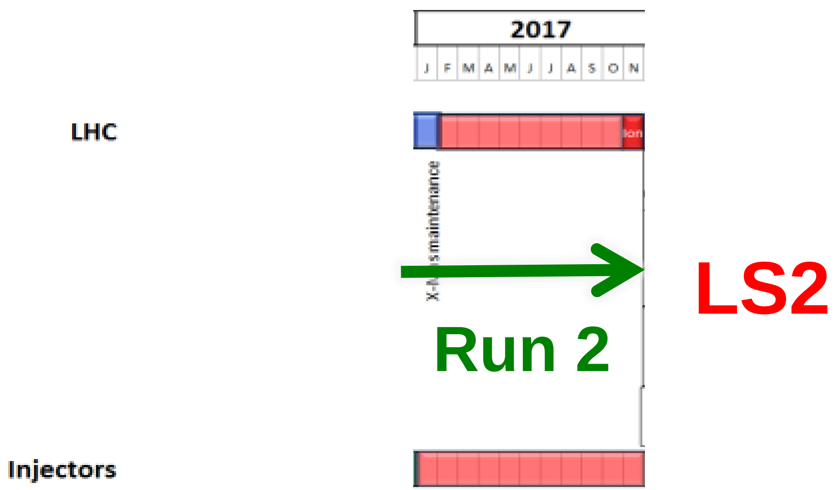






Run2: 3 years Operation Run after LS1





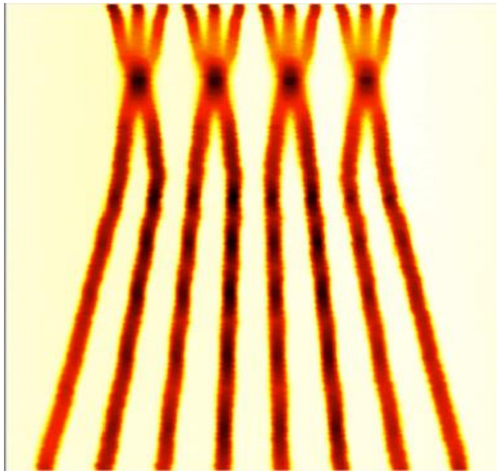
Run 2:
Start with 6.5 TeV and later decision towards 7 TeV according to magnet training

Expectations after Long Shutdown 1 (2015)

- Collisions at least at **13 TeV** c.m.
- **25 ns** bunch spacing

  Using new injector beam production scheme (BCMS), resulting in brighter beams.

Batch Compression and Merging and splitting (BCMS)



Courtesy of the LIU-PS project team

- **β^* ≤ 0.5m** (was 0.6 m in 2012)
- Other conditions:
  - Similar turn around time
  - Similar machine availability
- Expected maximum luminosity: **1.6×10^{34} cm^{-2} s^{-1}** ± 20%
  - Limited by inner triplet heat load limit, due to collisions debris

	Number of bunches	Intensity per bunch	Transverse emittance	Peak luminosity	Pile up	Int. yearly luminosity
25 ns BCMS	2508	1.15×10^{11}	1.9 μm	1.6×10^{34} $cm^{-2}s^{-1}$	~43	~42 fb^{-1}

Potential performance

	Number of bunches	Ib LHC [1e11]	Collimator scenario	Emit LHC (SPS) [um]	Peak Lumi [$cm^{-2}s^{-1}$]	~Pile-up	Int. Lumi [fb^{-1}]
25 ns	2760	1.15	S1	3.5 (2.8)	9.2e33	21	24
25 ns low emit	***2508***	***1.15***	***S4***	***1.9 (1.4)***	***1.6e34***	***43***	***42***
50 ns	1380	1.6	S1	2.3 (1.7)	1.7e34 levelling 0.9e34	76 levelling 40	~45*
50 ns low emit	1260	1.6	S4	1.6 (1.2)	2.2e34	108	…

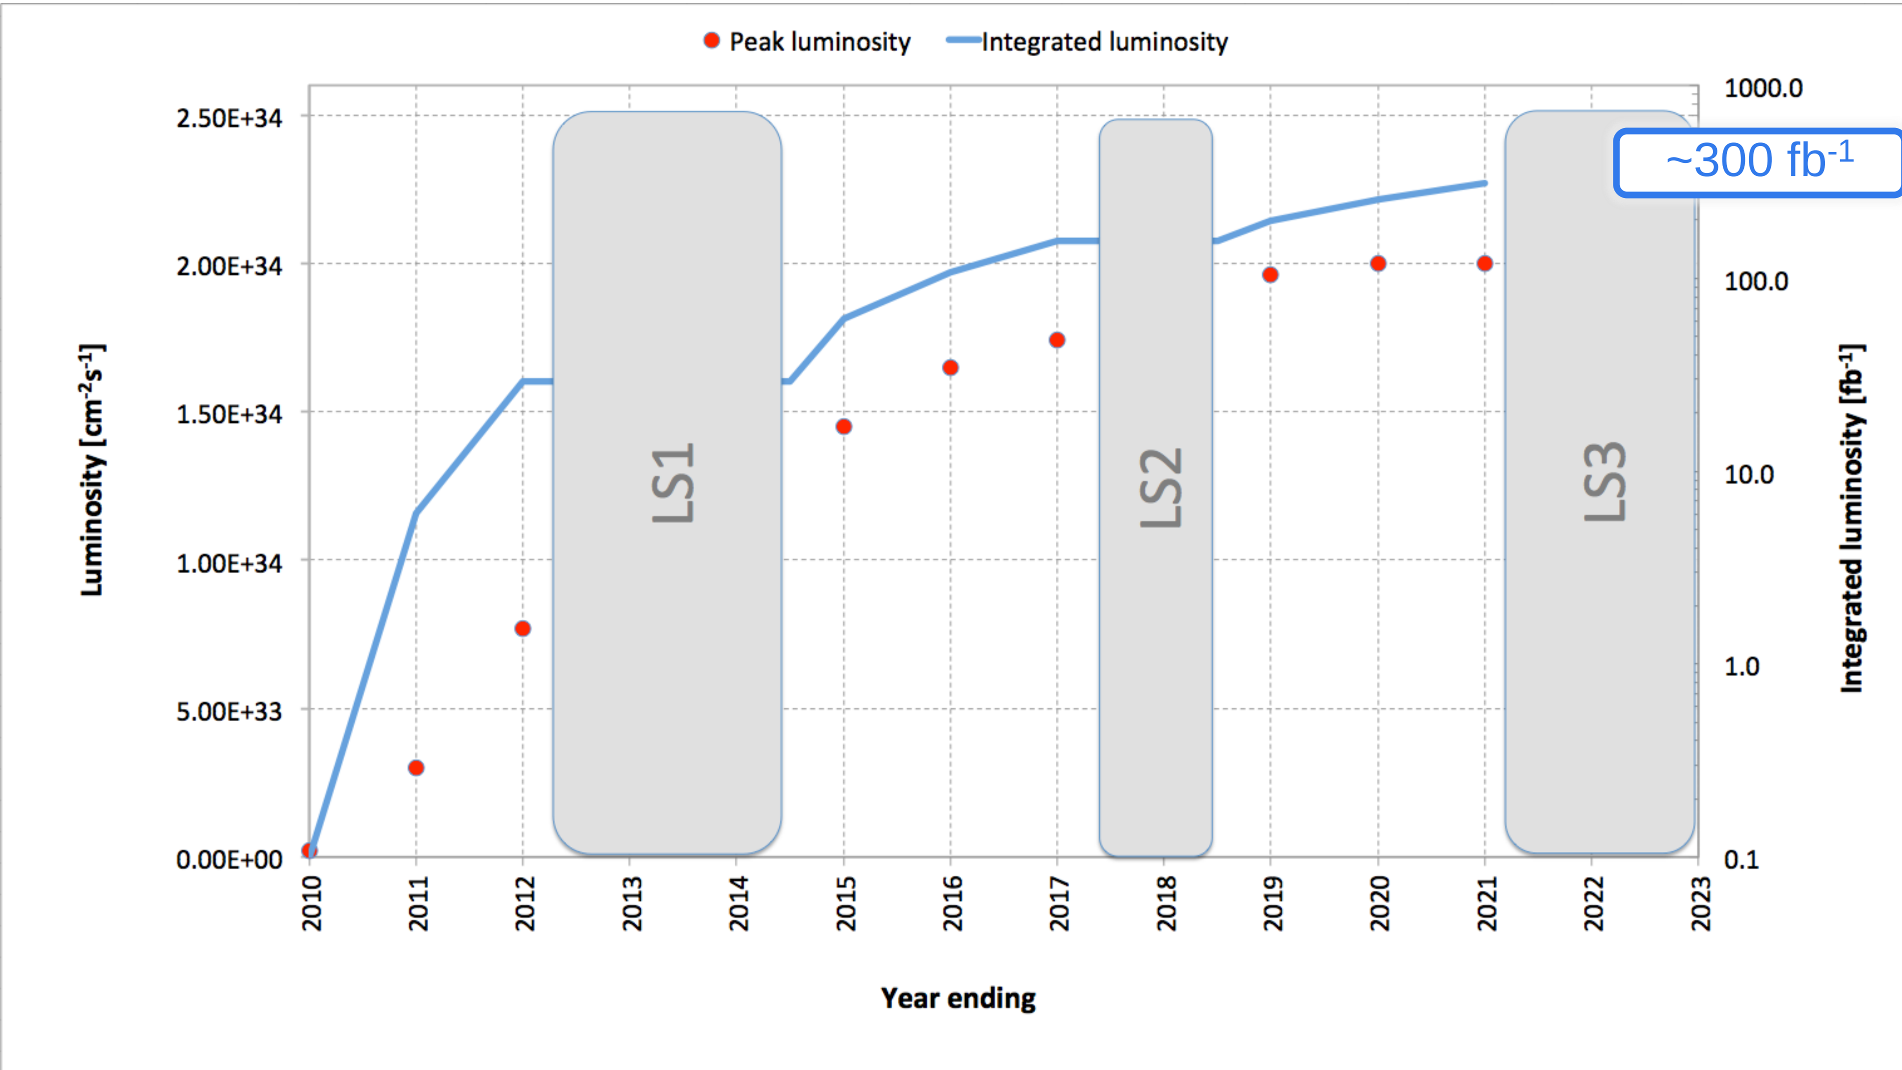
- **6.5 TeV**
- **1.1 ns bunch length**
- **150 days proton physics, HF = 0.2**

All numbers approximate

* different operational model – caveat - unproven

Courtesy Mike Lamont

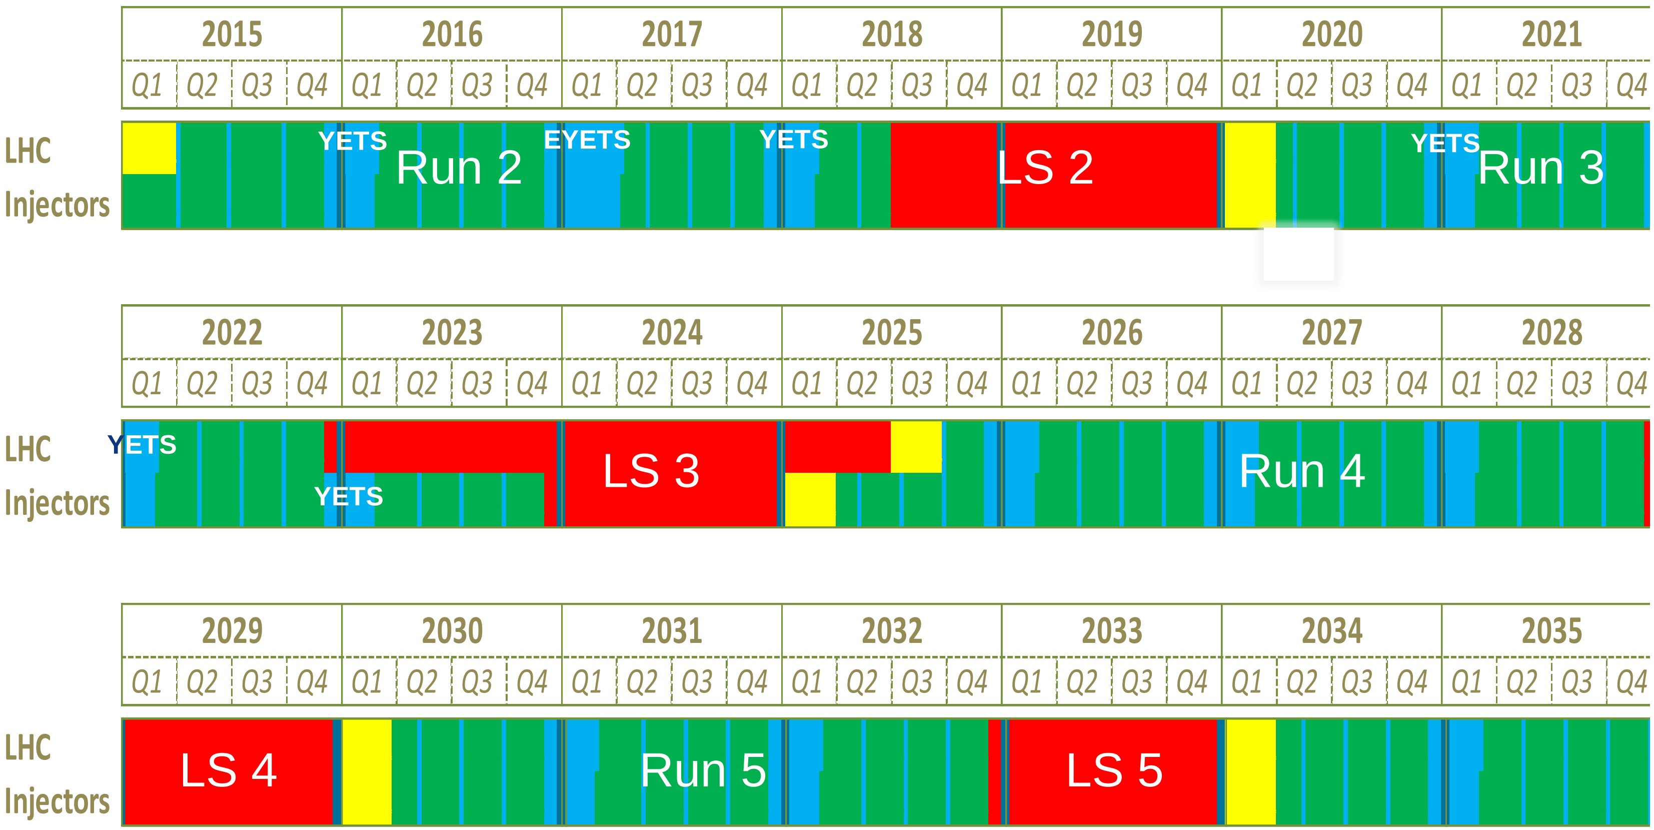
"Baseline" luminosity



LHC schedule beyond LS1

No Linac4 connection during Run2 - only EYETS* (13+6 weeks)
LS2 starting in 2018 (July) => 18 months + 3 months BC
LS3 LHC: starting in 2023 => 30 months + 3 months BC
Injectors: in 2024 => 13 months + 3 months BC

- Physics
- Shutdown
- Beam commissioning
- Technical stop



***) Extended Year End Technical Stop**

LHC schedule approved by CERN management and LHC experiments spokespersons and technical coordinators
Monday 2nd December 2013

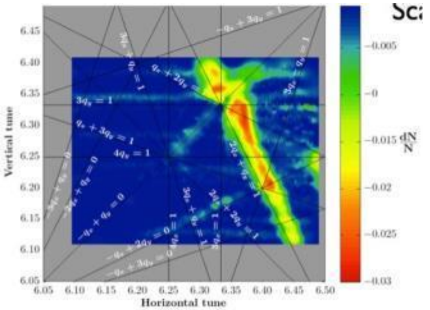
LS2 : (2018), LHC Injector Upgrades (LIU)

LINAC4 – PS Booster:

- H^- injection and increase of PSB injection energy from 50 MeV to 160 MeV, to increase PSB space charge threshold
- New RF cavity system, new main power converters
- Increase of extraction energy from 1.4 GeV to 2 GeV

PS:

- Increase of injection energy from 1.4 GeV to 2 GeV to increase PS space charge threshold
- Transverse resonance compensation
- New RF Longitudinal feedback system
- New RF beam manipulation scheme to increase beam brightness



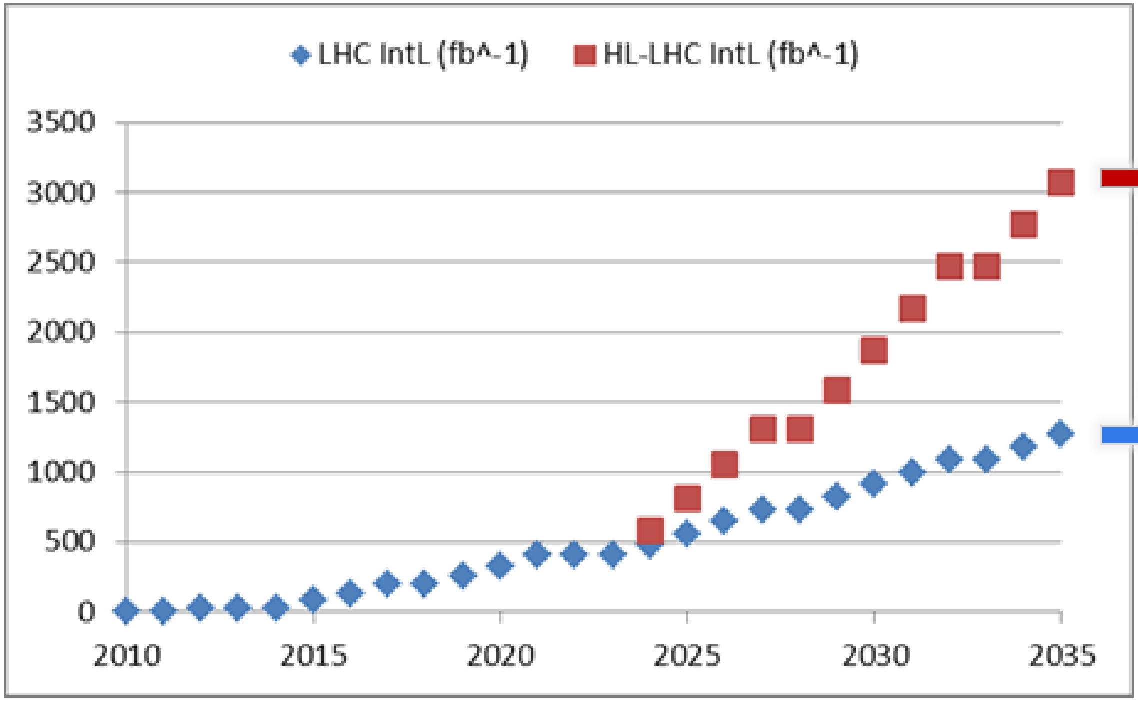
SPS

- Electron Cloud mitigation – strong feedback system, or coating of the vacuum system
- Impedance reduction, improved feedbacks
- Large-scale modification to the main RF system

These are only the main modifications and this list is far from exhaustive
Project leadership: R. Garoby and M. Meddahi

Why High-Luminosity LHC ? (LS3)

High Luminosity LHC



By implementing HL-LHC

Almost a factor 3

By continuous performance improvement and consolidation

Around 300 fb^{-1} the present Inner Triplet magnets reach the end of their useful life (due to radiation damage) and must be replaced.

Goal of HL-LHC project:

- 250 – 300 fb^{-1} per year
- **3000 fb^{-1} in about 10 years**

The European Strategy for Particle Physics Update 2013

c) *Europe's top priority should be the **exploitation of the full potential of the LHC**, including the high-luminosity upgrade of the machine and detectors with a view to collecting **ten times more data than in the initial design, by around 2030**. This upgrade programme will also provide further exciting opportunities for the study of flavour physics and the quark-gluon plasma.*

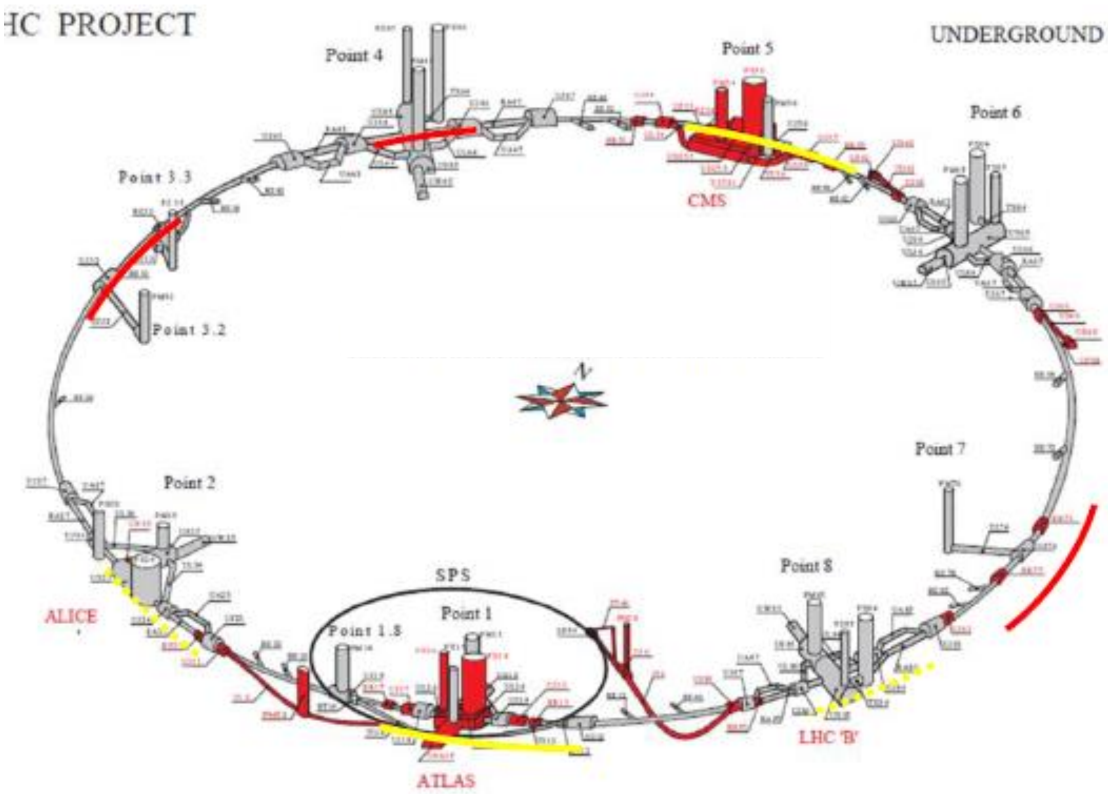
HL-LHC from a study to a PROJECT

$300\ fb^{-1} \rightarrow 3000\ fb^{-1}$

including LHC injectors upgrade **LIU**

(Linac 4, Booster 2GeV, PS and SPS upgrade)

The HL-LHC Project



- New IR-quads Nb_3Sn (inner triplets)
- New 11 T Nb_3Sn (short) dipoles
- Collimation upgrade
- Cryogenics upgrade
- Crab Cavities
- Cold powering
- Machine protection
- …

Major intervention on more than 1.2 km of the LHC

Project leadership: L. Rossi and O. Brüning

Squeezing the beams: High Field SC Magnets

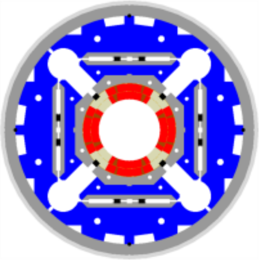
Quads for the inner triplet

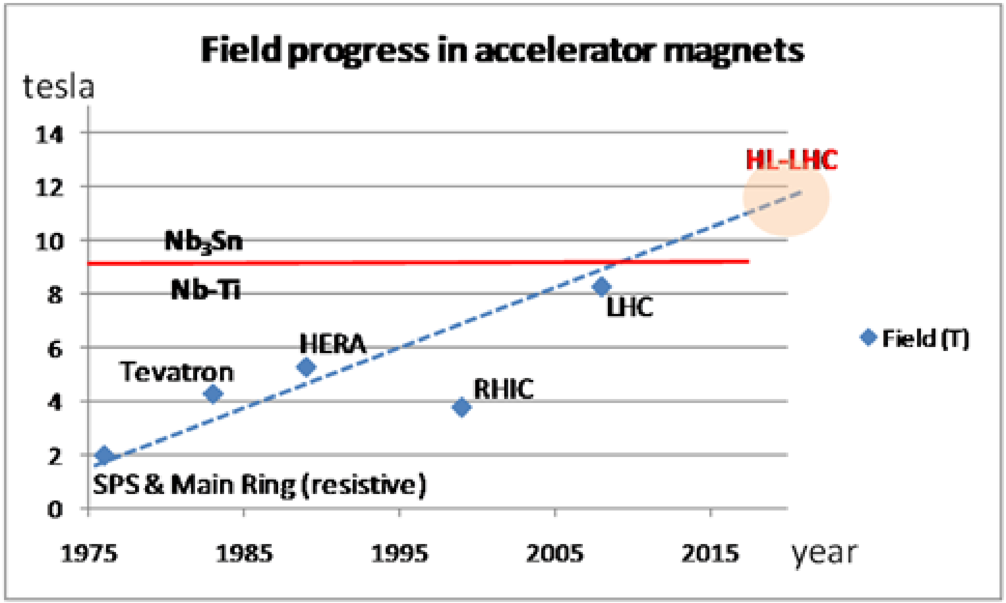
Decision 2012 for low-β quads

Aperture ∅ 150 mm – 140 T/m

(B_{peak} ≈12.3 T)

(LHC: 8 T, 70 mm)





More focus strength,

β* as low as 15 cm (55 cm in LHC)

thanks to ATS (Achromatic Telescopic Squeeze) optics

In some scheme even β down to 7.5 cm are considered*

- Dipoles for beam recombination/separation capable of 6-8 T with 150-180 mm aperture (LHC: 1.8 T, 70 mm)
- Dipoles 11 T for LS2 (see later)

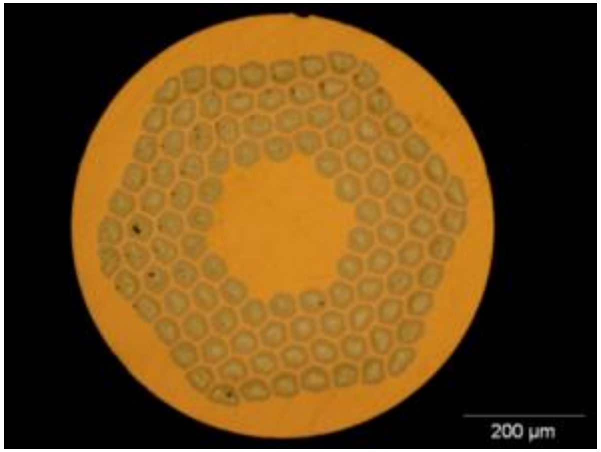
Courtesy Lucio Rossi

The « new » material : Nb_3Sn

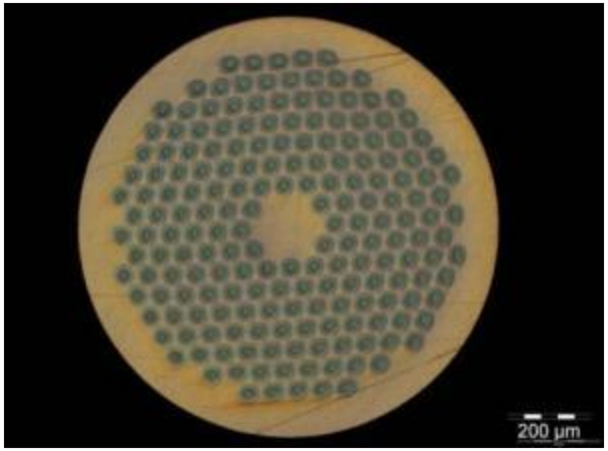
- Recent 23.4 T (1 GHz) NMR Magnet for spectroscopy in Nb_3Sn (and Nb-Ti).
- 15-20 tons/year for NMR and HF solenoids. Experimental MRI is taking off
- ITER: 500 tons in 2010-2015!

  It is comparable to LHC *(1200 tons of Nb-Ti but HL-LHC will require only 20 tons of Nb_3Sn)*

- HEP ITD (Internal Tin Diffusion):
  - High Jc., 3xJc ITER
  - Large filament (50 µm), large coupling current...
  - Cost is 5 times LHC Nb-Ti

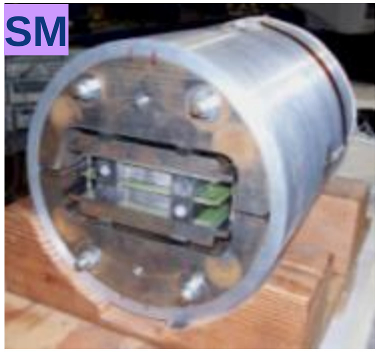


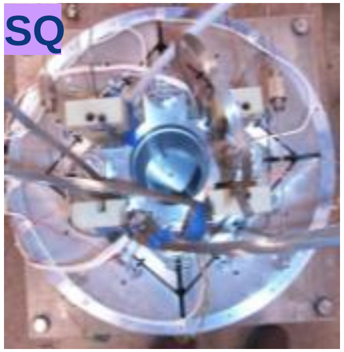
0.7 mm, 108/127 stack RRP from **Oxford OST**

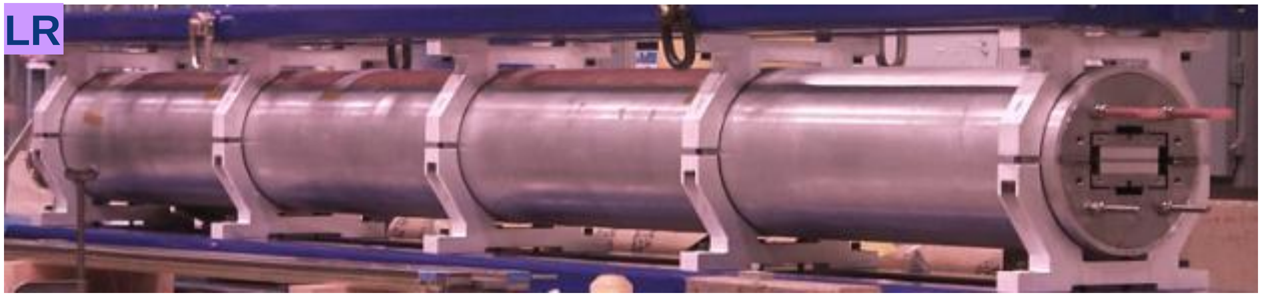


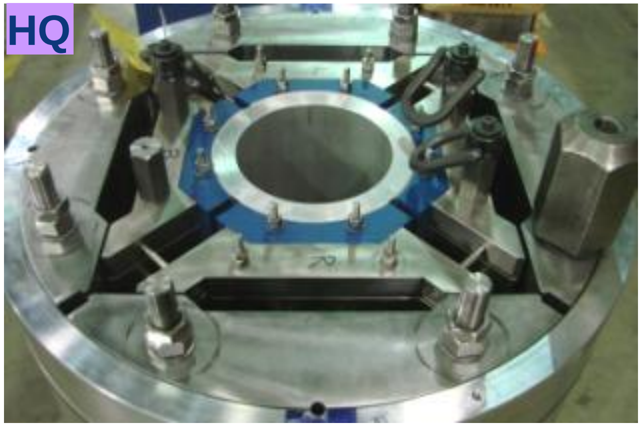
1 mm, 192 tubes PIT from **Bruker EAS**

LARP (US LHC program) Magnets



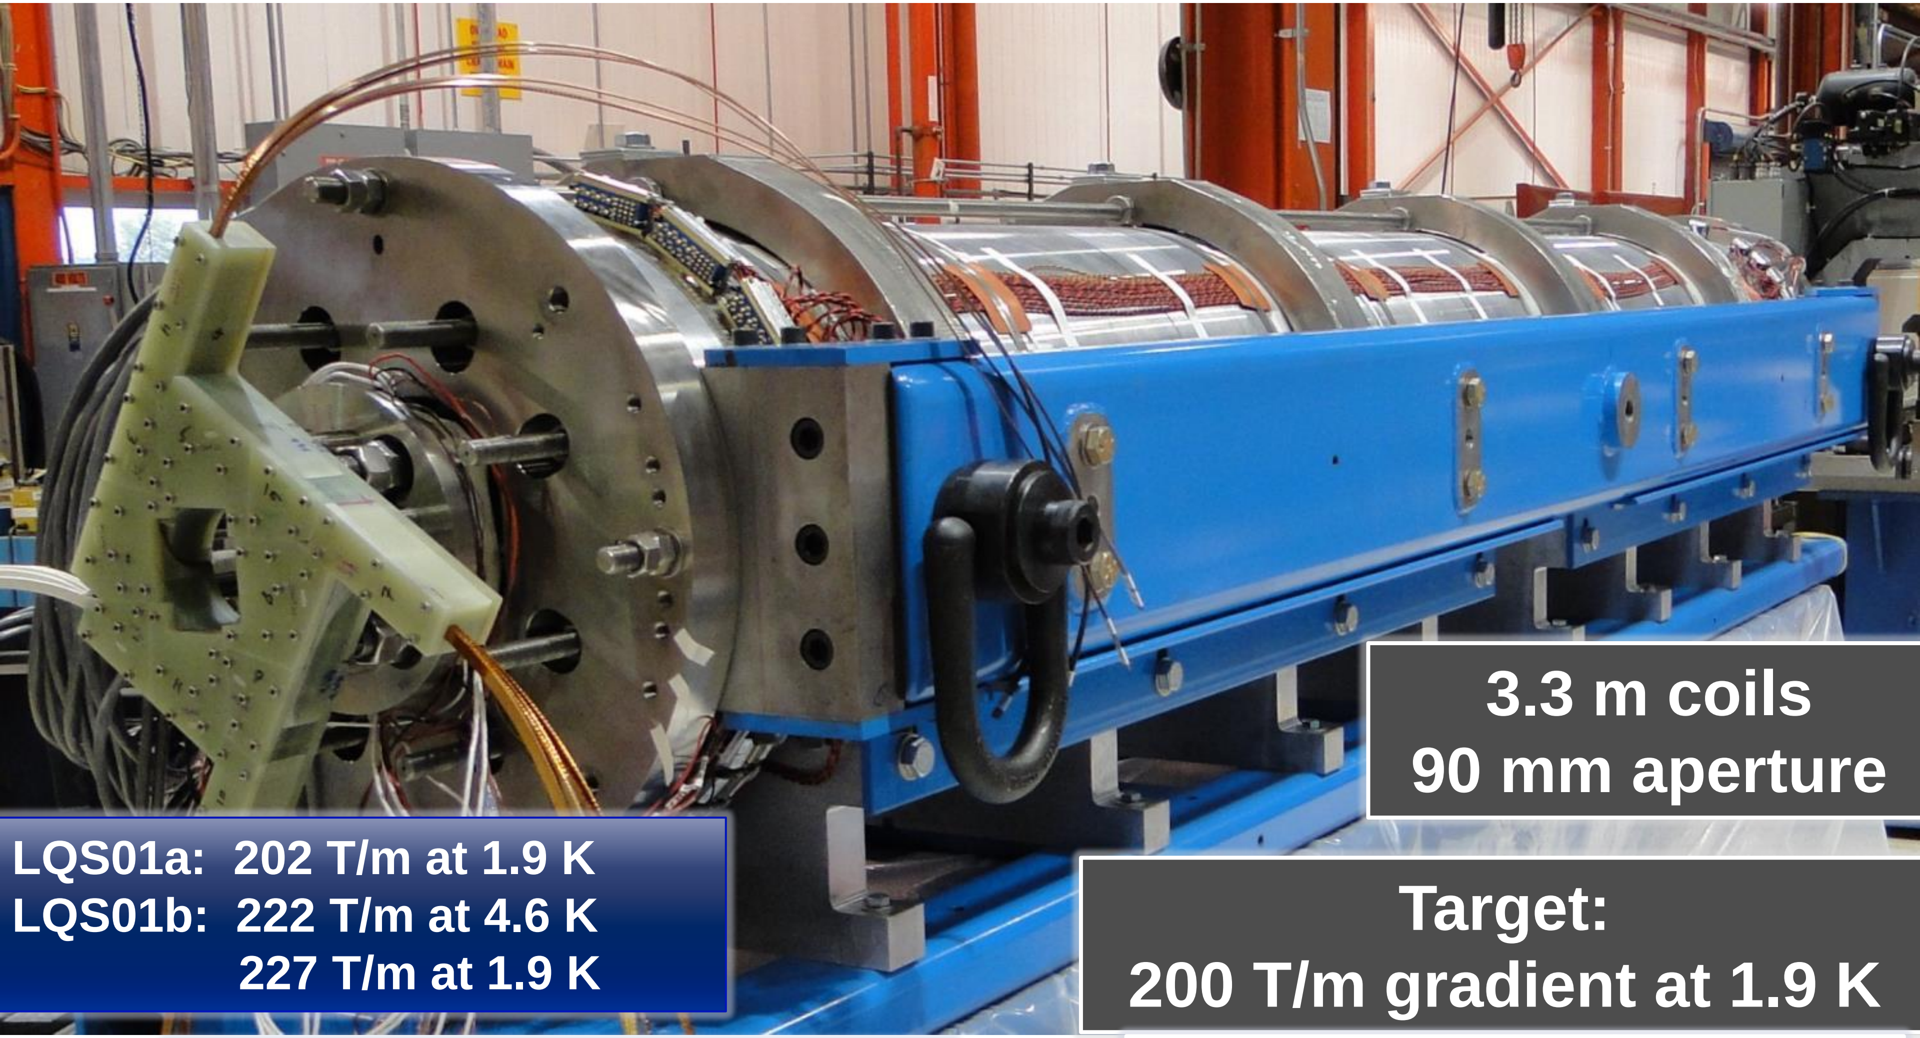






LQS of LARP

Courtesy: G. Ambrosio FNAL and G. Sabbi , LBNL



3.3 m coils
90 mm aperture

LQS01a: 202 T/m at 1.9 K
LQS01b: 222 T/m at 4.6 K
227 T/m at 1.9 K

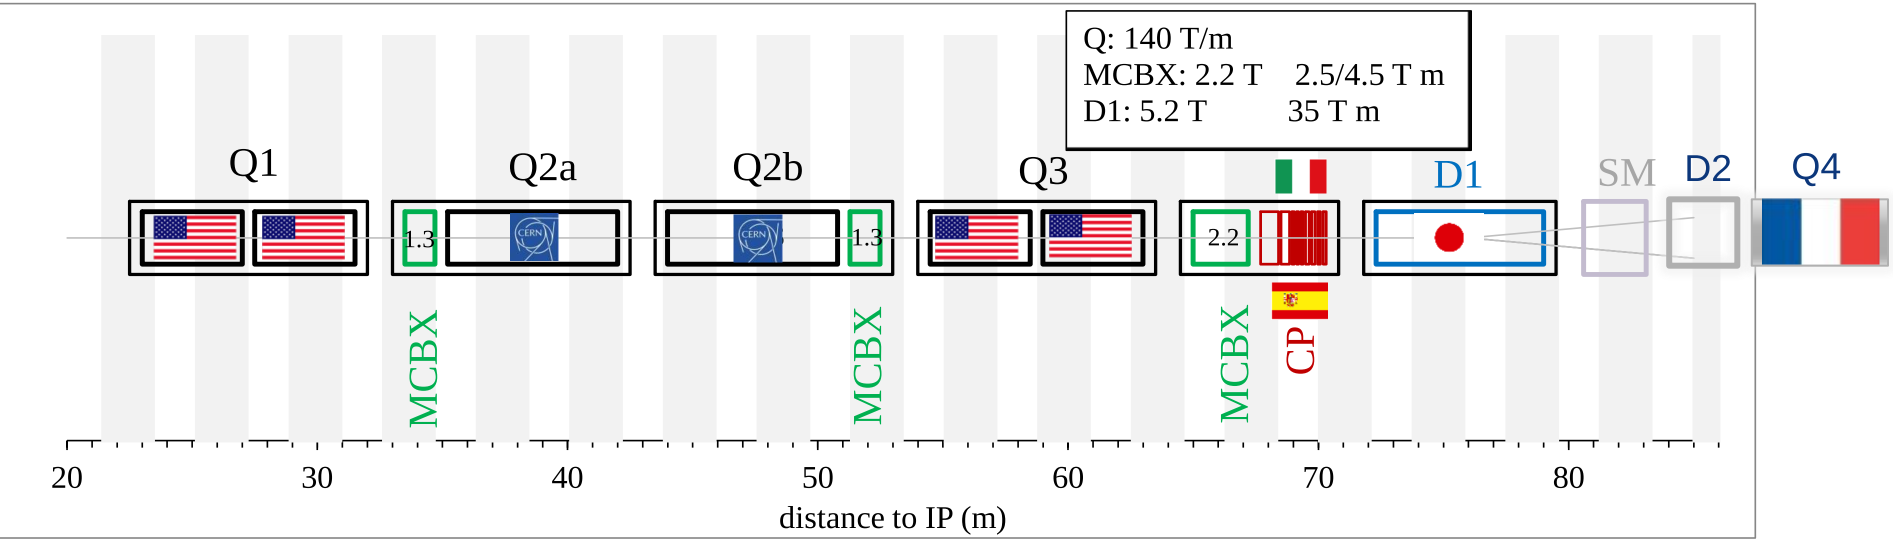
Target:
200 T/m gradient at 1.9 K

LQS02: 198 T/m at 4.6 K 150 A/s
208 T/m at 1.9 K 150 A/s
limited by one coil

LQS03: 208 T/m at 4.6 K
210 T/m at 1.9 K
1st quench: 86% s.s. limit

Setting up International collaboration

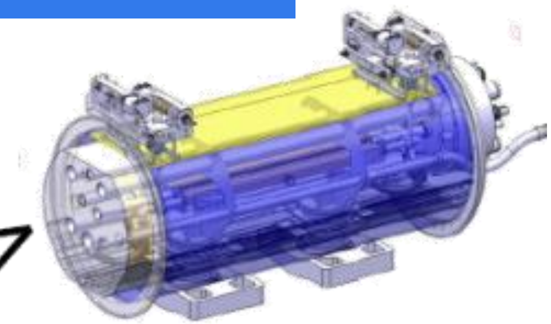
with national laboratories but also involving industrial firms

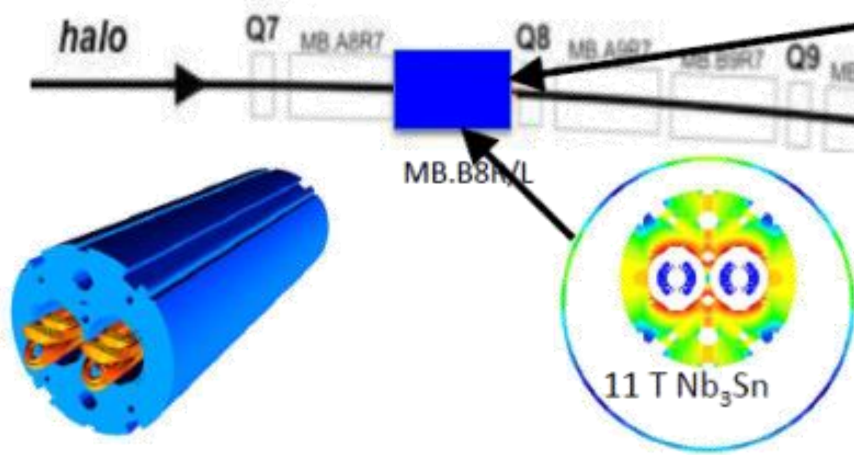


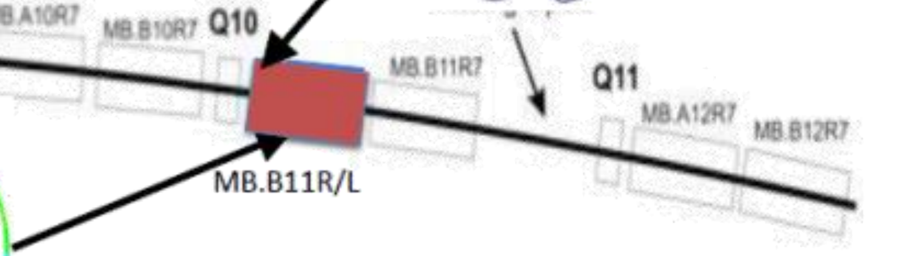
Baseline layout of HL-LHC IR region

LS2 : collimators and 11T Dipole

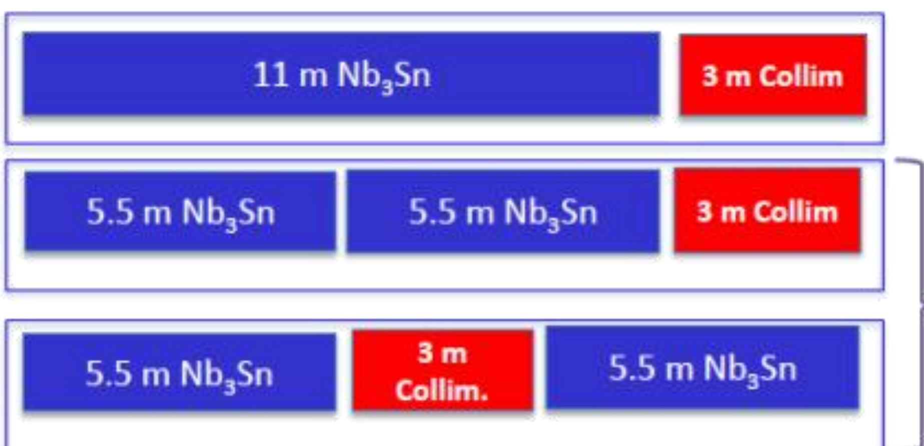
- LS2 2017-18: Point-X,7 & IR-2
- LS3 2020+: IR1,5 as part of HL-LHC







$\int BdL$ = 119.2 Tm @ I_{nom} = 11.85 kA
in series with MB with 20 % margin

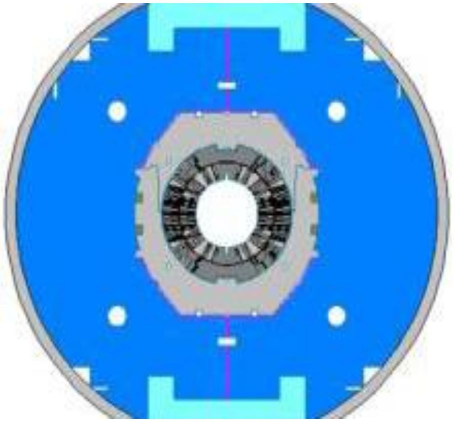


LS2: 12 coldmass + 2 spares = 14 CM
LS3: 8 coldmass + 2 spares = 10 CM
Total 24 CM

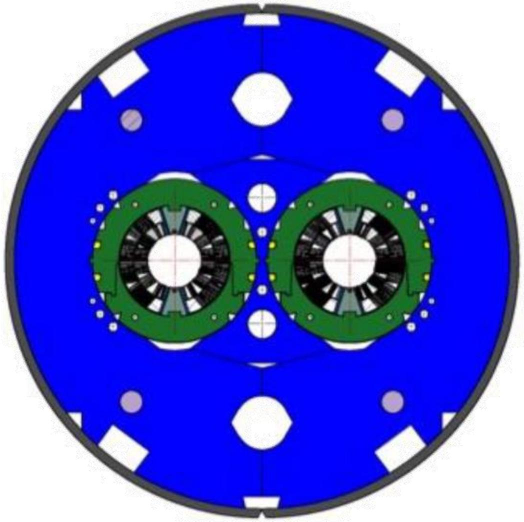
LS2: 24 coldmass + 4 spares = 28 CM
LS3: 16 coldmass + 4 spares = 20 CM
Total 48 CM

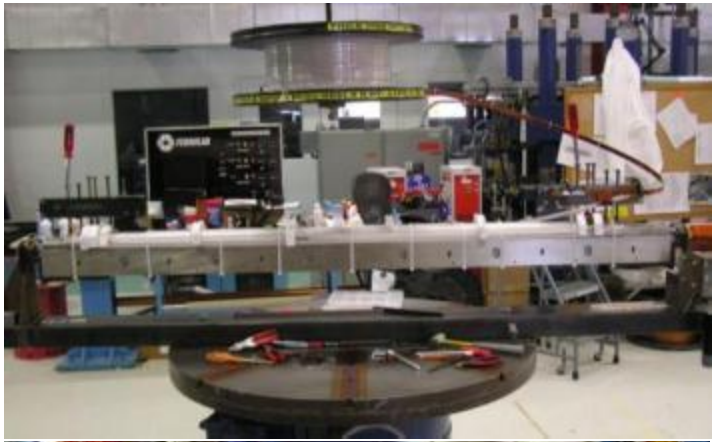
Nb_3Sn 11T Dipole R&D

Single aperture model



Twin aperture model

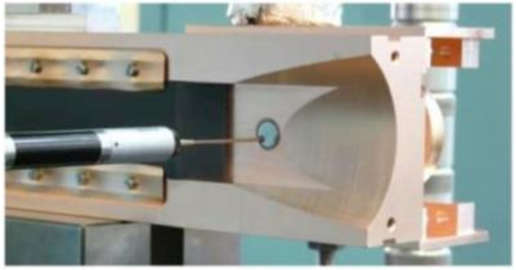




IR Collimation Upgrade

Update of present collimation system during LS1:

- Replace existing collimators
- Reduce setup time (gain of factor ~100)
- Improved monitoring



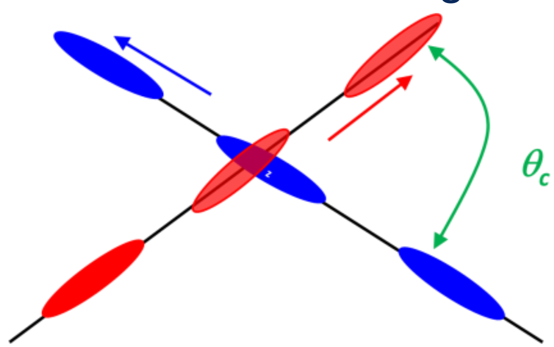
For HL-LHC add dispersion suppressor collimation

- Eliminate off-momentum particles in a region with high dispersion
- Technology of choice for the DS collimators is warm with by-pass cryostat
- **low impedance collimators: coating with Molybdenum**
- Design completed with 4.5 m integration length.
- Prototyping on-going

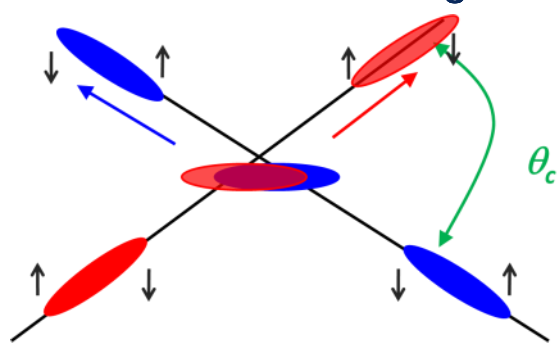
Crab Cavities, Increase “Head on”

Aim: reduce the effect of the crossing angle

Without crabbing



Without crabbing



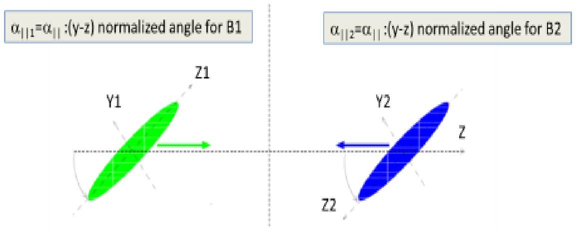
RF-Dipole Nb prototype

4-rod in SM18 for RF measurements

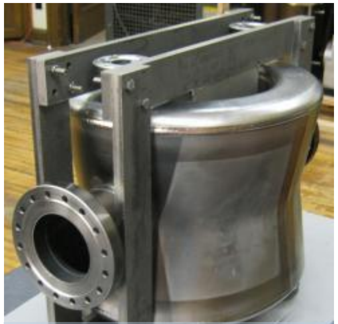
New crossing strategy under study to soften the pile-up density:

some new schemas have interesting potential as “crab-kissing”, to be discussed with all experiments

(“Pile-up at HL-LHC and possible mitigation” Stephane Fartoukh)



- 3 proto types available
- Cavity tests are on-going
- Test with beam in SPS foreseen in 2015-2016
- Beam test in LHC foreseen in 2017



DQWR prototype
17-Jan-2013

Thinking to cryomodule…

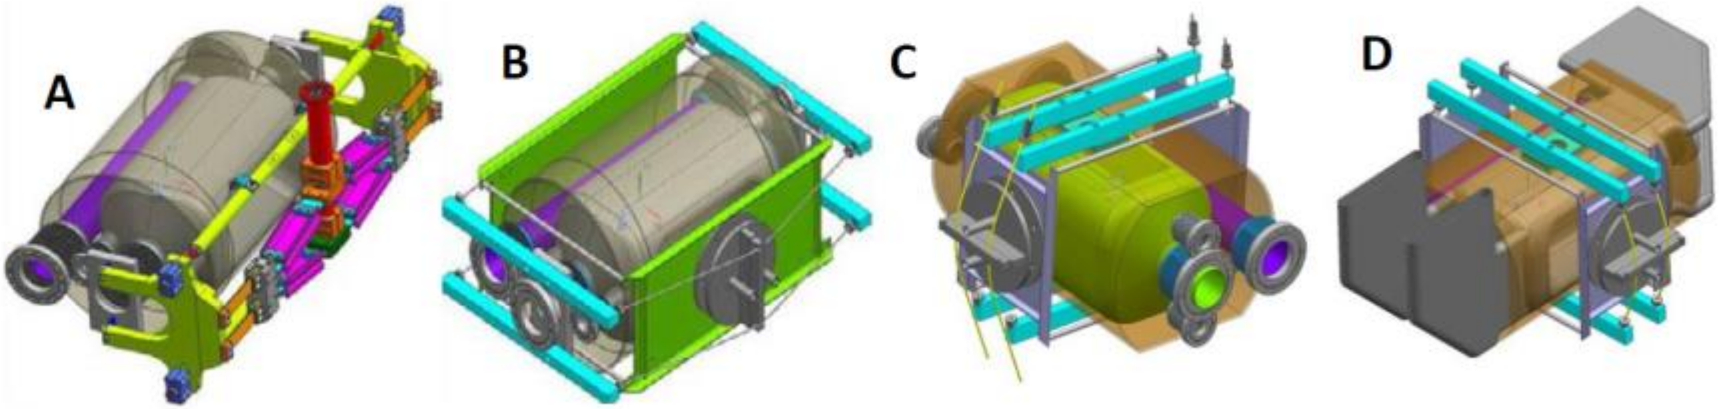


Figure 1: LHC crab cavity cryostat concept – A) JLab design, B) ANL design (helium pressure actuates bellows), C) ANL design (tuner deforms cavity outer surfaces), D) Waveguide

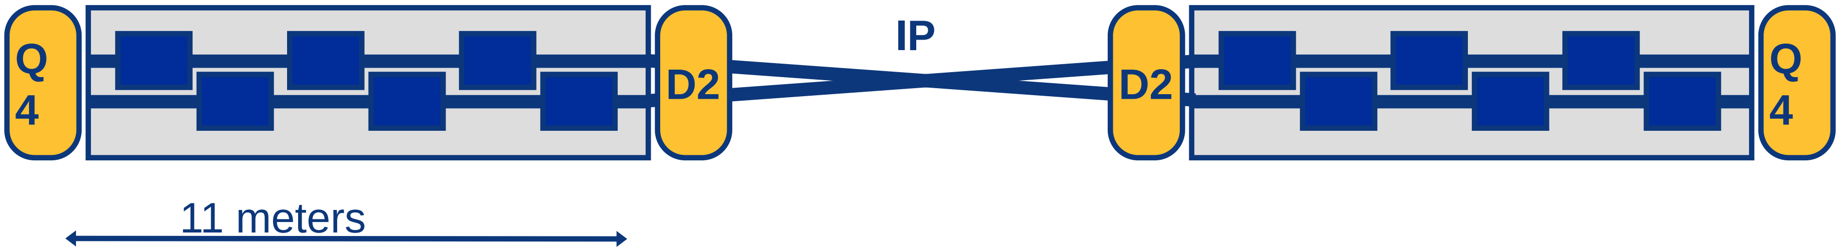
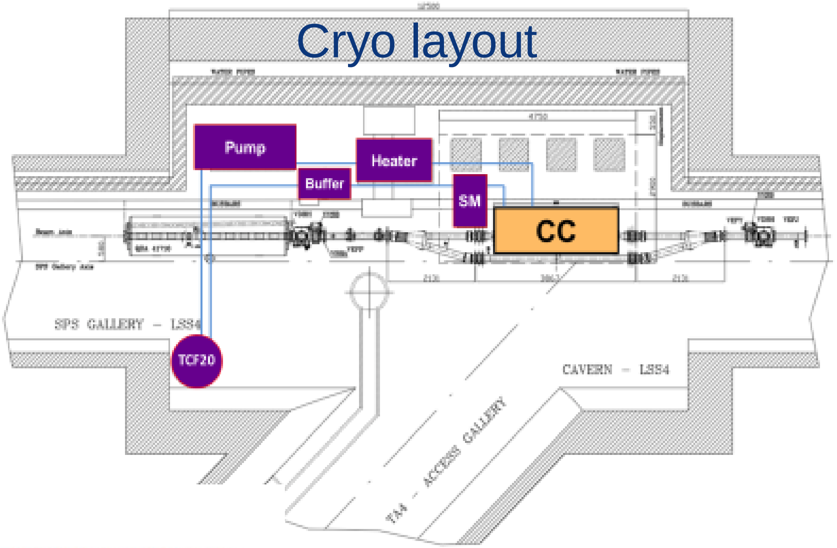
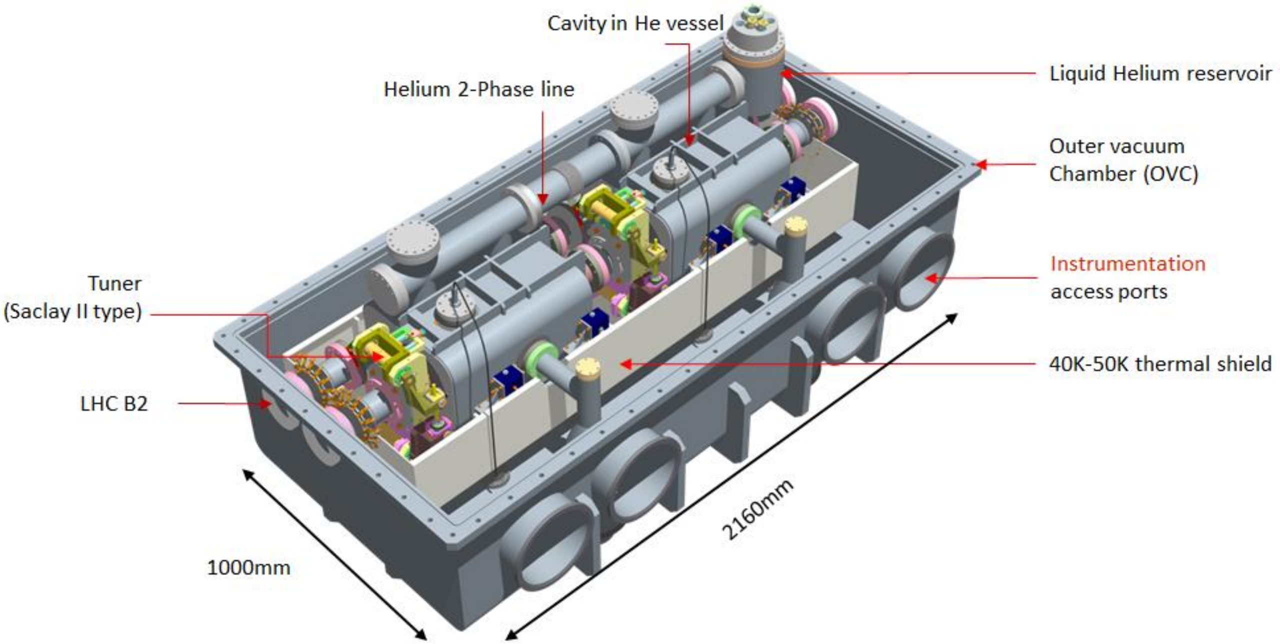


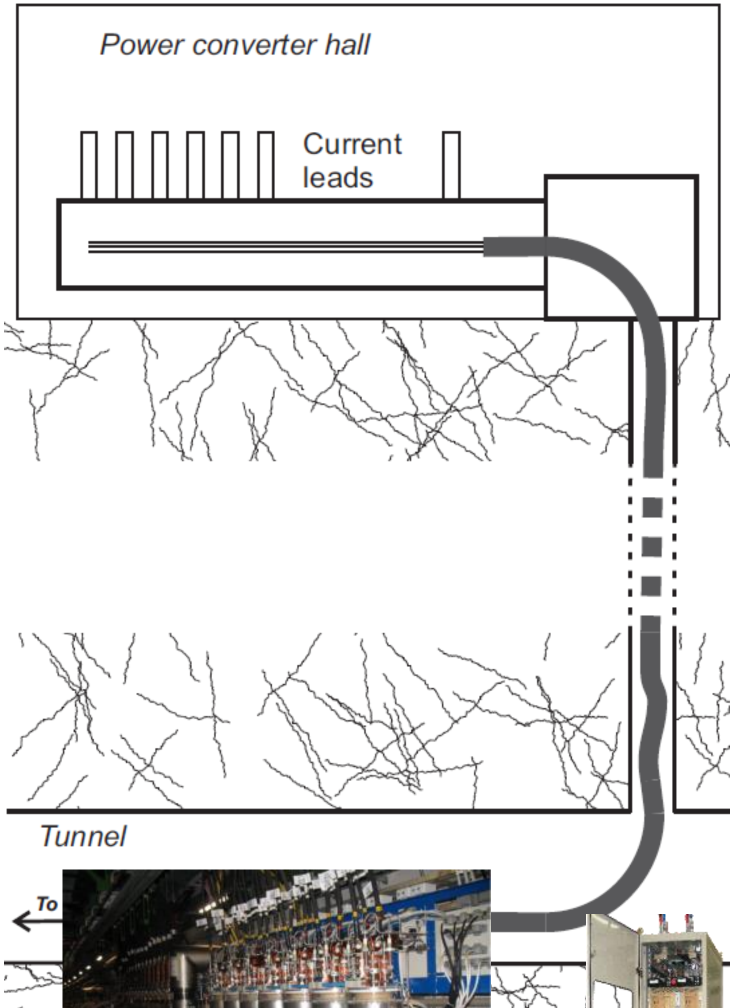
Courtesy Lucio Rossi

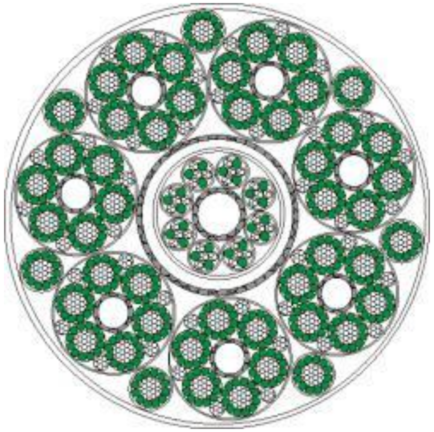
…and to test with beam in the CERN SPS (2016-2017)





R2E: Removal of Power Converter (200kA-5 kV SC cable, 100 m height)





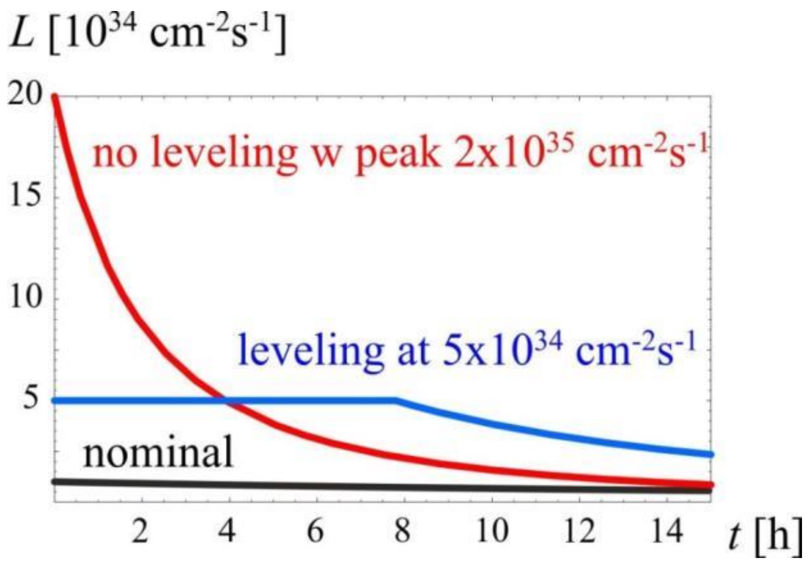
Φ = 62 mm

MgB$_2$
(or other HTS)

7 × 14 kA, 7 × 3 kA and 8 × 0.6 kA cables – Itot~120 kA @ 30 K

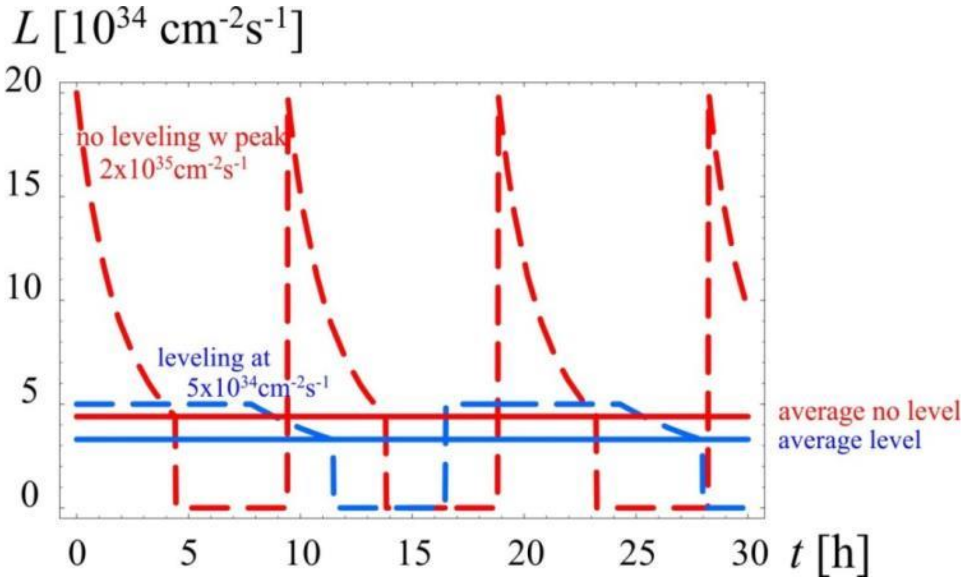
Also DFBs (current lead boxes) removed to surface
Final solution to R2E problem – in some points
Make room for shielding un-movable electronics
Make the maintenance and application of ALARA principle much easier and effective

Luminosity Levelling, a key to success



- High peak luminosity
- Minimize pile-up in experiments and provide "constant" luminosity

- Obtain about 3 - 4 fb^{-1}/day (40% stable beams)
- About 250 to 300 fb^{-1}/year



Baseline parameters of HL for reaching 250 -300 fb^{-1}/year

25 ns is the option

However:

50 ns should be kept as alive and possible because we DO NOT have enough experience on the actual limit *(e-clouds, I_{beam})*

Continuous global optimisation with LIU

	25 ns	50 ns
# Bunches	2808	1404
p/bunch [10^{11}]	**2.0 (1.01 A)**	**3.3 (0.83 A)**
ε_L [eV.s]	2.5	2.5
σ_z [cm]	7.5	7.5
$\sigma_{\delta p/p}$ [10^{-3}]	0.1	0.1
$\gamma\varepsilon_{x,y}$ [μm]	**2.5**	**3.0**
β^* [cm] (baseline)	15	15
X-angle [μrad]	**590 (12.5 σ)**	**590 (11.4 σ)**
Loss factor	0.30	0.33
Peak lumi [10^{34}]	6.0	7.4
Virtual lumi [10^{34}]	20.0	22.7
$T_{leveling}$ [h] @ 5E34	**7.8**	**6.8**
#Pile up @5E34	123	247

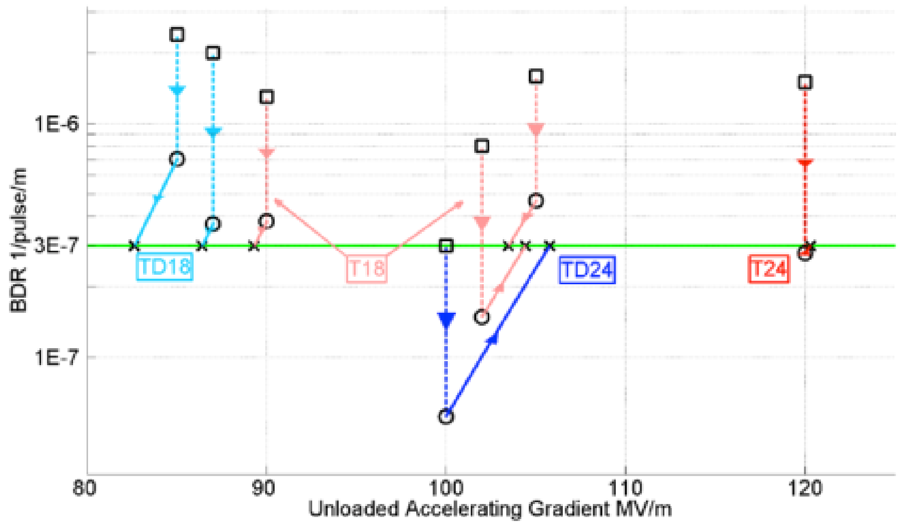
“to propose an ambitious **post-LHC accelerator project at CERN** by the time of the next Strategy update”

d) *CERN should undertake design studies for accelerator projects in a global context,*

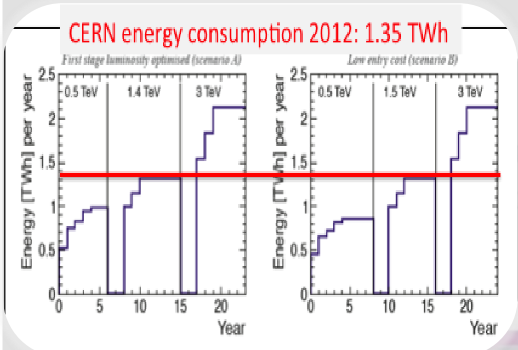
*with emphasis on **proton-proton and electron-positron high-energy frontier machines**. These design studies should be coupled to a vigorous accelerator **R&D programme**, including **high-field magnets** **and** **high-gradient accelerating** **structures**, **in collaboration with national institutes, laboratories and universities worldwide.***

HGA



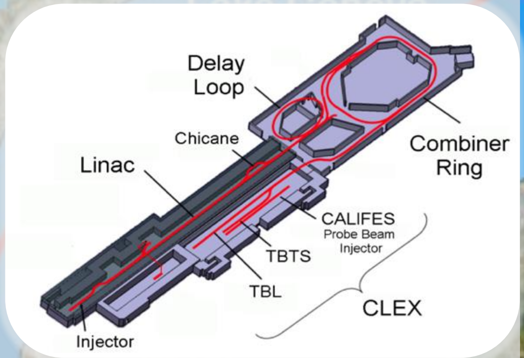
And also R&D on Proton-Driven Plasma Wakefield Acceleration (AWAKE Expt at CERN)

CLIC developments towards 2018



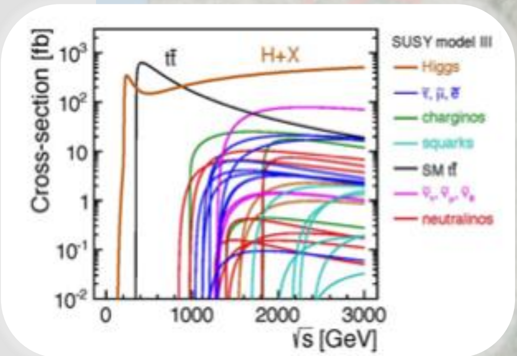
A re-baselined staged project plan, cost and power optimisation, increased industrialisation effort for cost-drivers

High Gradient structure development and significantly increased test-capacity for X-band RF-structures



System-test programmes in CTF3, at ATF and FACET, as well as system-tests in collaborative programmes with light-source laboratories

Technical systems developments, related among others to complete modules, alignment/stability, instrumentation and power sources



Physics studies related to energy frontier capabilities and potential new physics as it emerges from LHC

CLIC workshop 2014

3-7 February 2014

This workshop will cover **Accelerator as well as the Detector and Physics studies**, with its present status and programme for the coming years.

For the Accelerator studies, the workshop spans over 5 days: Feb 3rd-7th
For the Detector and Physics studies, the workshop spans over 3 days: Feb 3rd -5th

Please register by filling-in the registration form in the left menu.

Common parts:

1. There will be an open plenary session on Monday afternoon February 3rd, giving an overview of the CLIC project (accelerator, physics/detector), placed in the context of other studies for machines at the energy frontier.
2. Workshop dinner on Wednesday evening

Dedicated **Accelerator sessions**:

1. Parallel sessions on Tuesday and Wednesday, where we attempt to have presentations of as many as possible of the activities inside the CLIC/CTF3 collaboration, and also some special meetings related to key "CLIC technologies" (for example FP7 project and WP meetings with strong links)
2. A session Thursday covering High Gradient NC accelerators for industrial and medical applications as well as XFELs, using CLIC and other high gradient technology developments
3. A plenary session on the Friday morning focussing on systemtests of key CLIC challenges
4. A Collaboration Board Friday afternoon

Dedicated **Detector and Physics sessions**:

1. Parallel sessions on Tuesday and Wednesday chaired by co-conveners, attempting to give an overview of the current activities and future plans
2. An Institute Board meeting on Tuesday early evening.

We are looking for the widest possible participation and in particular we will encourage presentations and involvement of younger colleagues.

“to propose an ambitious **post-LHC accelerator project at CERN** by the time of the next Strategy update”

d) *CERN should undertake design studies for accelerator projects in a global context,*

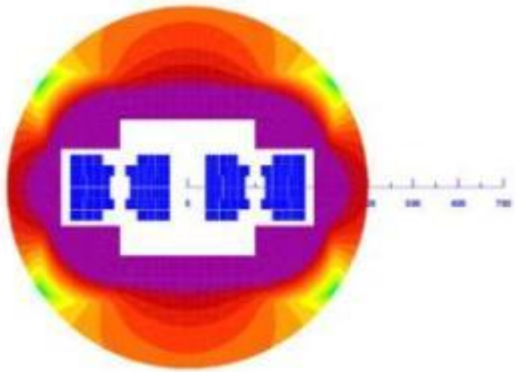
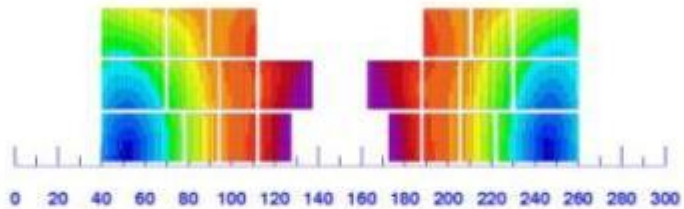
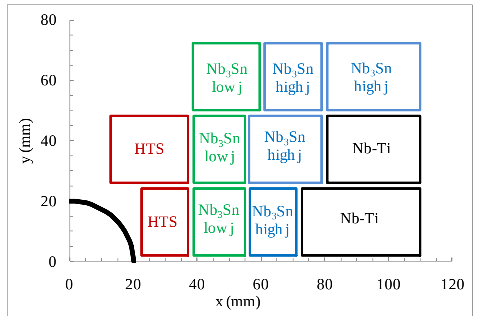
Malta Workshop: **HE-LHC @ 33 TeV c.o.m.**
14-16 October 2010







Material	N. turns	Coil fraction	Peak field	$J_{overall}$ (A/mm^2)
Nb-Ti	41	27%	8	380
Nb3Sn (high Jc)	55	37%	13	380
Nb3Sn (Low Jc)	30	20%	15	190
HTS	24	16%	20.5	380

Magnet design (20 T): very challenging but not impossible.

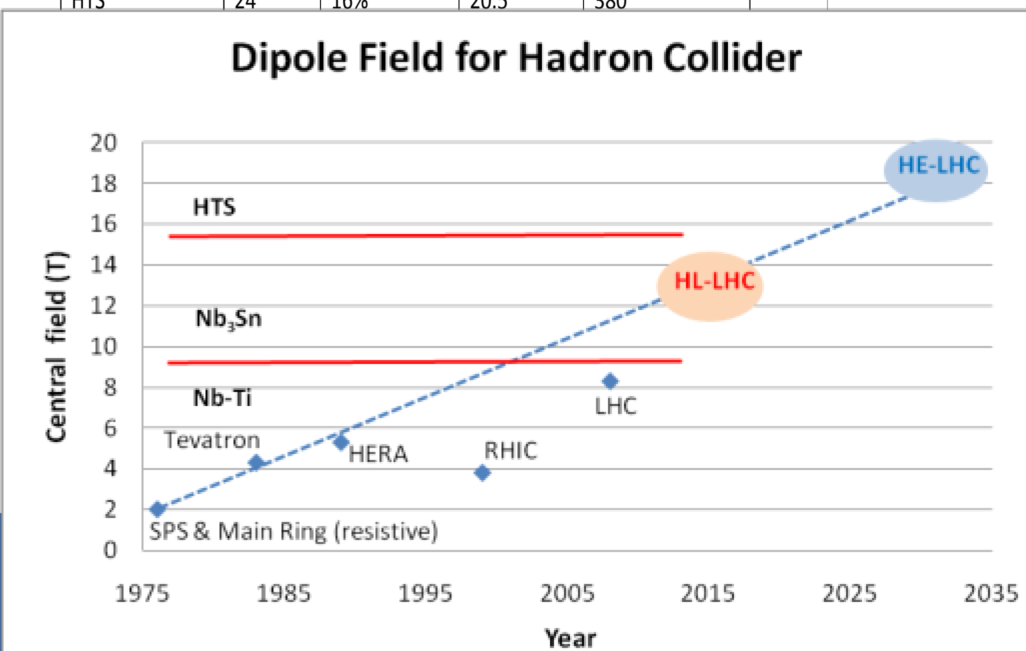
300 mm inter-beam

Multiple powering in the same magnet (and more sectioning for energy)

Work for 4 years to assess HTS for 2X20T to open the way to 16.5 T/beam .

Otherwise limit field to 15.5 T for 2x13 TeV

Higher INJ energy is desirable (2xSPS)



ng the beam screen at 60 K.

ks to dumping time.

IC. Reaching $2x10^{34}$ appears reasonable.

s beam handling for INJ & beam dump:

nake twice more room for LHC kickers.

HE-LHC main parameters

parameter	LHC	HL-LHC	HE-LHC
c.m. energy [TeV]	14		33

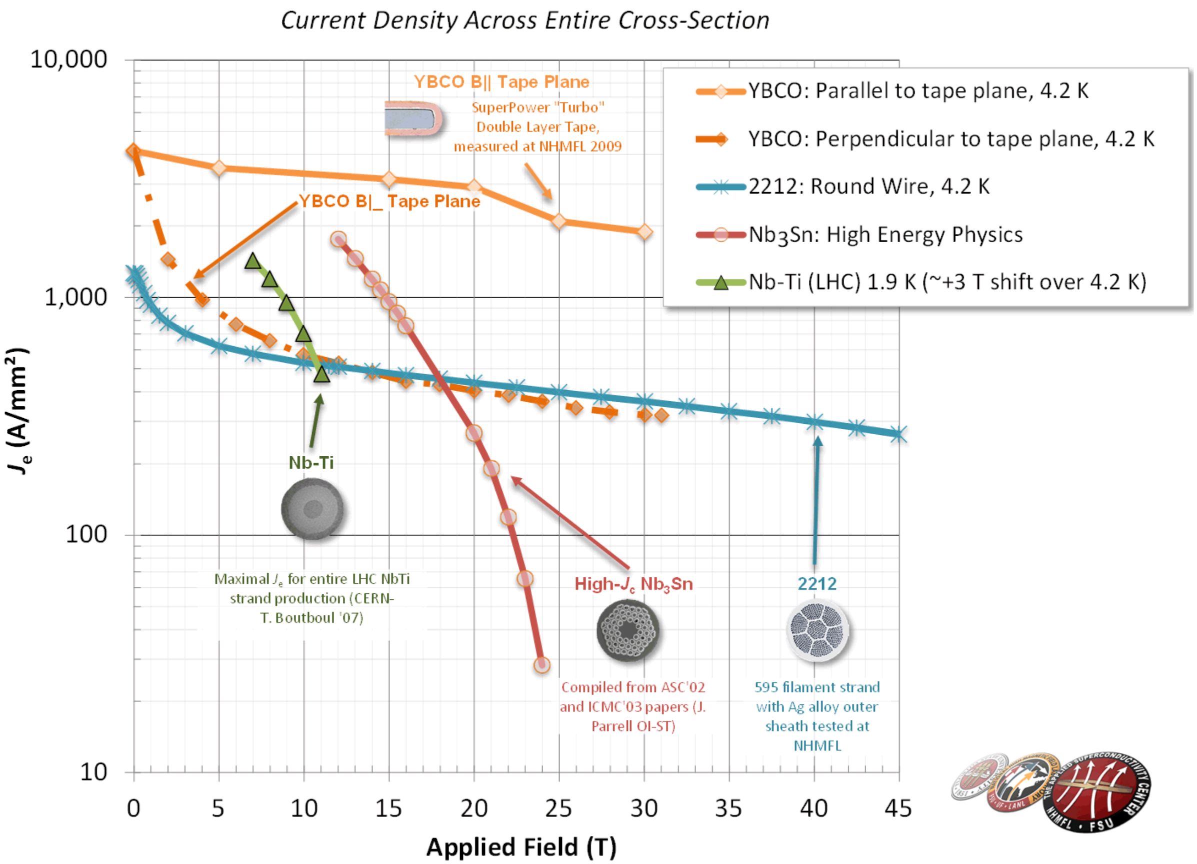
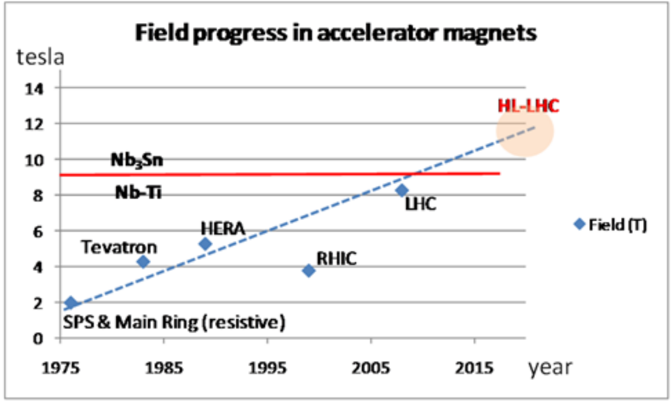
Superconductors: from materials to applications



Superconductors as seen by the eye of an engineer

The grand challenge of today is to develop the technology of **high-field superconductors** **(field quality,…)**

LTS (NbTi ; Nb_3Sn)



NbTi mature but limited to 9T

Is Nb_3Sn mature ? Yes, and no

performance of Nb_3Sn wires has seen a great boost in the past decade (factor 3 in J_C w/r to ITER)

However, Nb_3Sn magnets were never built nor operated in accelerators. Manufacturing, quench, training, protection, strain tolerance, field quality are the focus today to make this new technology a reality

Solid and aggressive R&D in HFM (High Field Magnet) for accelerators must be intensified

From Luca Bottura

HTS

Can HTS displace LTS ? Not today

Much needs to be done to bring this technology to a point where it can be sold as “mature”

Materials have potential that can be exploited

- OPHT for BSCCO-2212
- Thicker layer for YBCO tapes
- The Holy Grail of a round YBCO wire

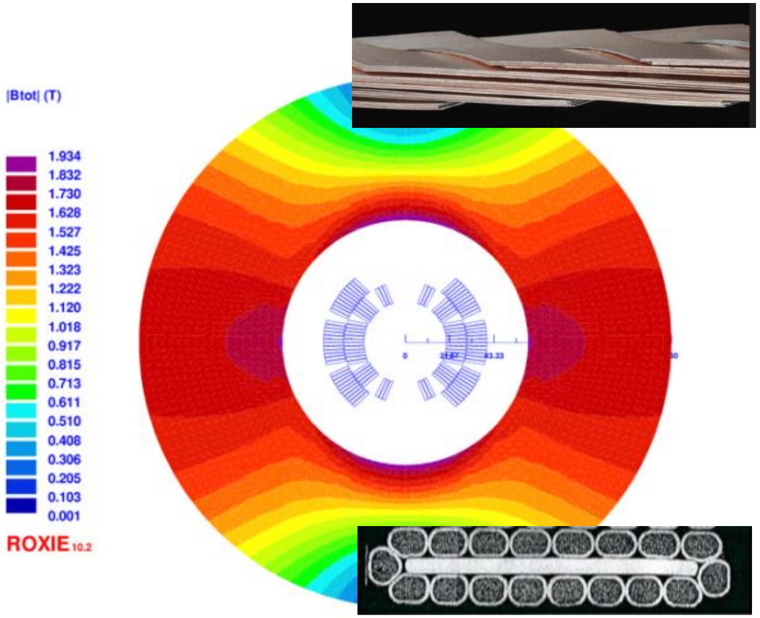
Production quantities, homogeneity and cost need to evolve

Step-up application demands, from self-field (SC-link is an ideal test-bed) to high-field accelerator magnets (feasibility)

From Luca B

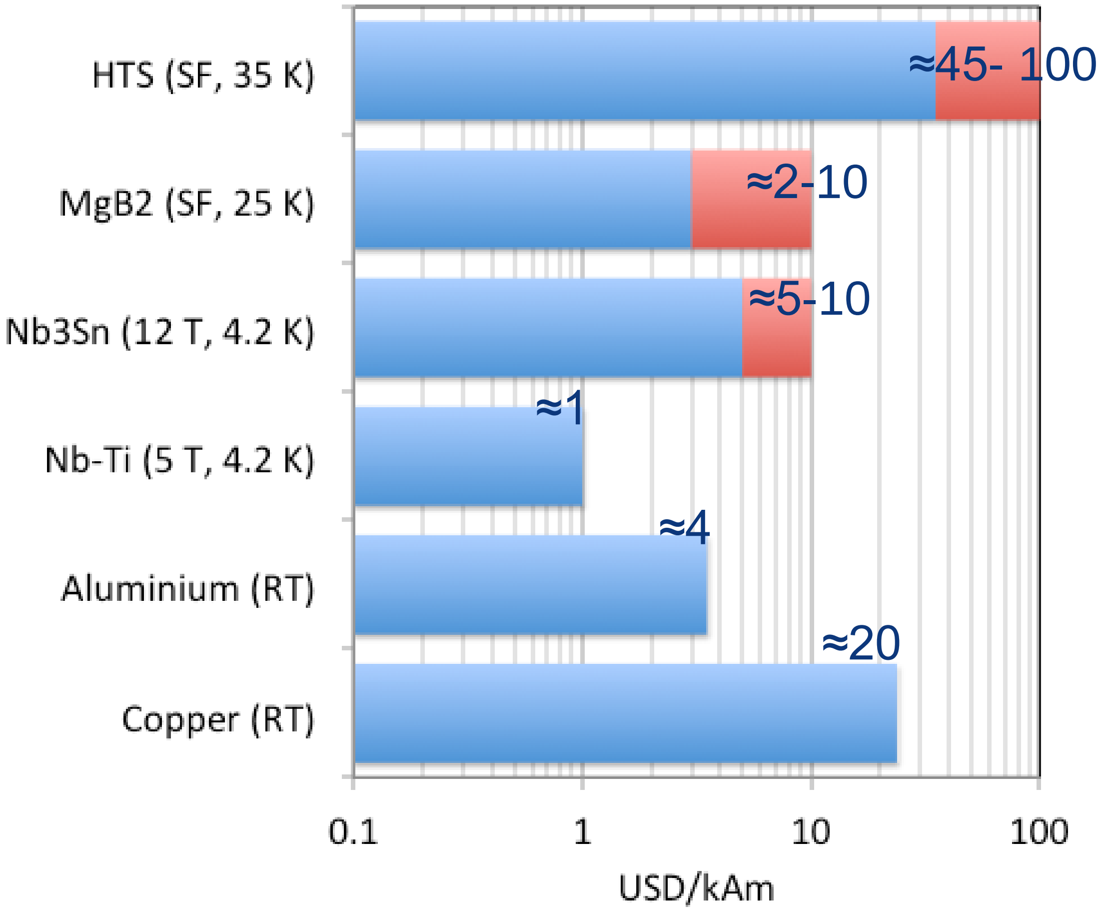
Program Eucard2 on HTS

EuCARD2: Develop 10 kA class HTS accelerator cable using Bi-2212 and YBCO. Test stability, magnetization, and strain tolerance



WP10: a 5 T, 40 mm bore HTS dipole

From materials to applications



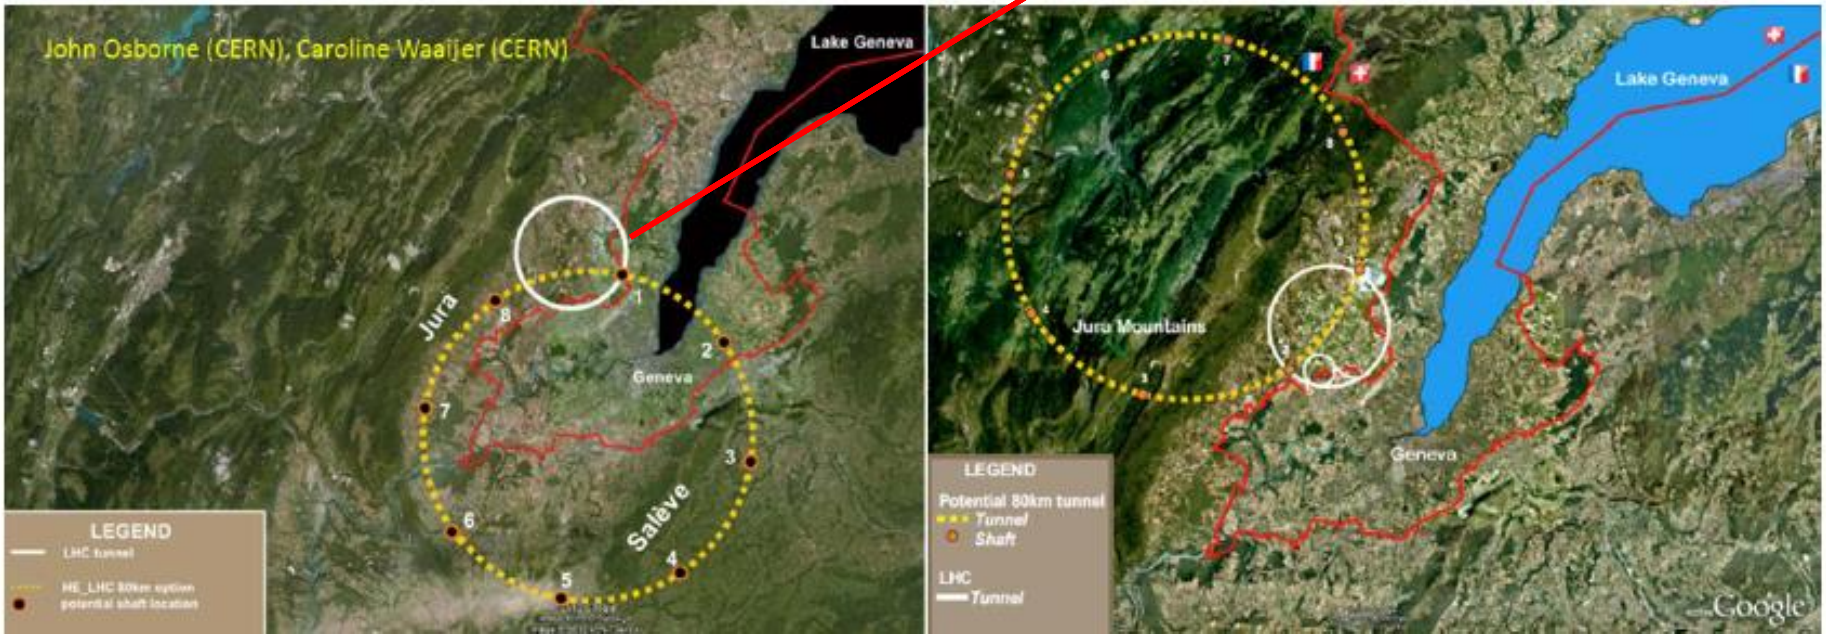
Superconductors as seen by the eye of a manager
The grand challenge of today is availability of **long lengths of reasonably priced commercial materials**

"Very High Energy LHC"

First studies on a new 80 km tunnel in the Geneva area

- **42 TeV with 8.3 T using present LHC dipoles**
- **80 TeV with 16 T based on Nb_3Sn dipoles**
- **100 TeV with 20 T based on HTS dipoles**

HE-LHC :33 TeV with 20T magnets



80-100 km tunnel infrastructure in Geneva area – design driven by pp-collider requirements

with possibility of e+-e- (TLEP) and p-e (VLHeC)

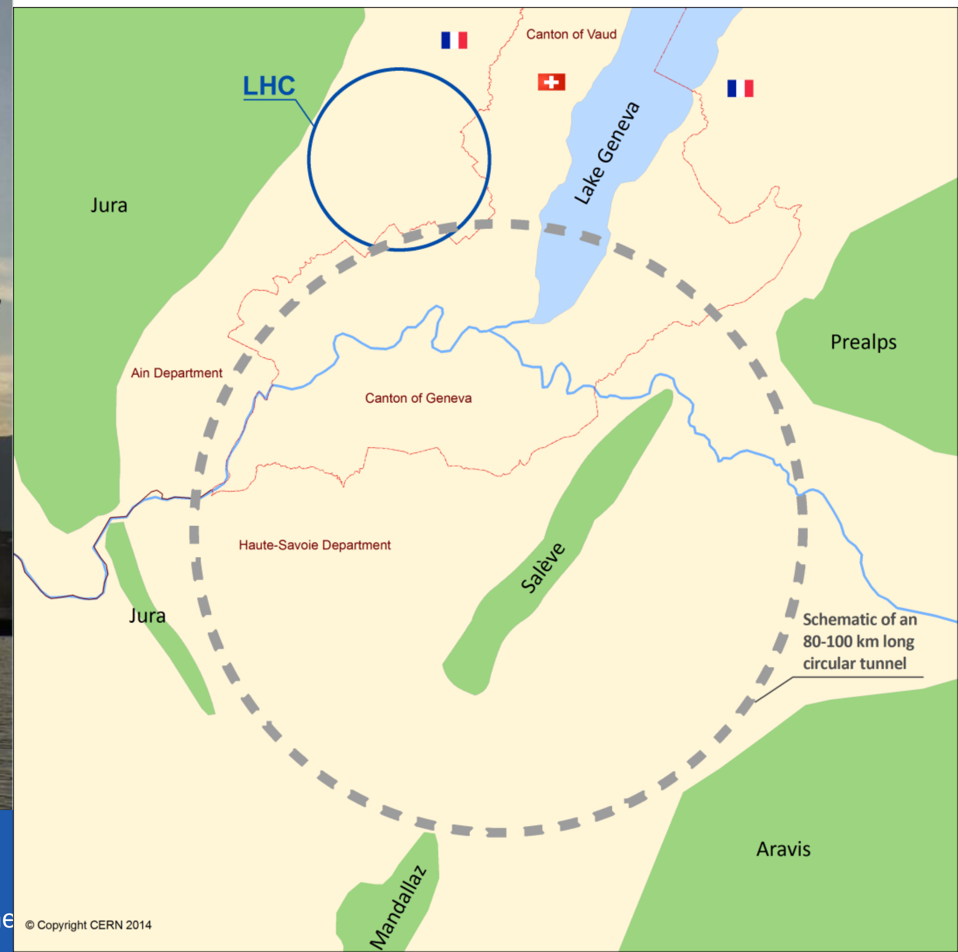
FCC Kick-off Meeting in Geneva next week

http://indico.cern.ch/e/fcc-kickoff



Conclusion: "Exploitation of the full potential of the LHC"

- LS1 [2013-2014] : 1st beams in 2015
- Run 2 : 13 TeV – 25 ns – up to 1.7 10^{34} $cm^{-2}.s^{-1}$, 40-45 fb^{-1} per year
- LS2 (higher intensity - LIU) [2018 or 2019]
- Run 3 (up to ~2.0 10^{34} $cm^{-2}.s^{-1}$)

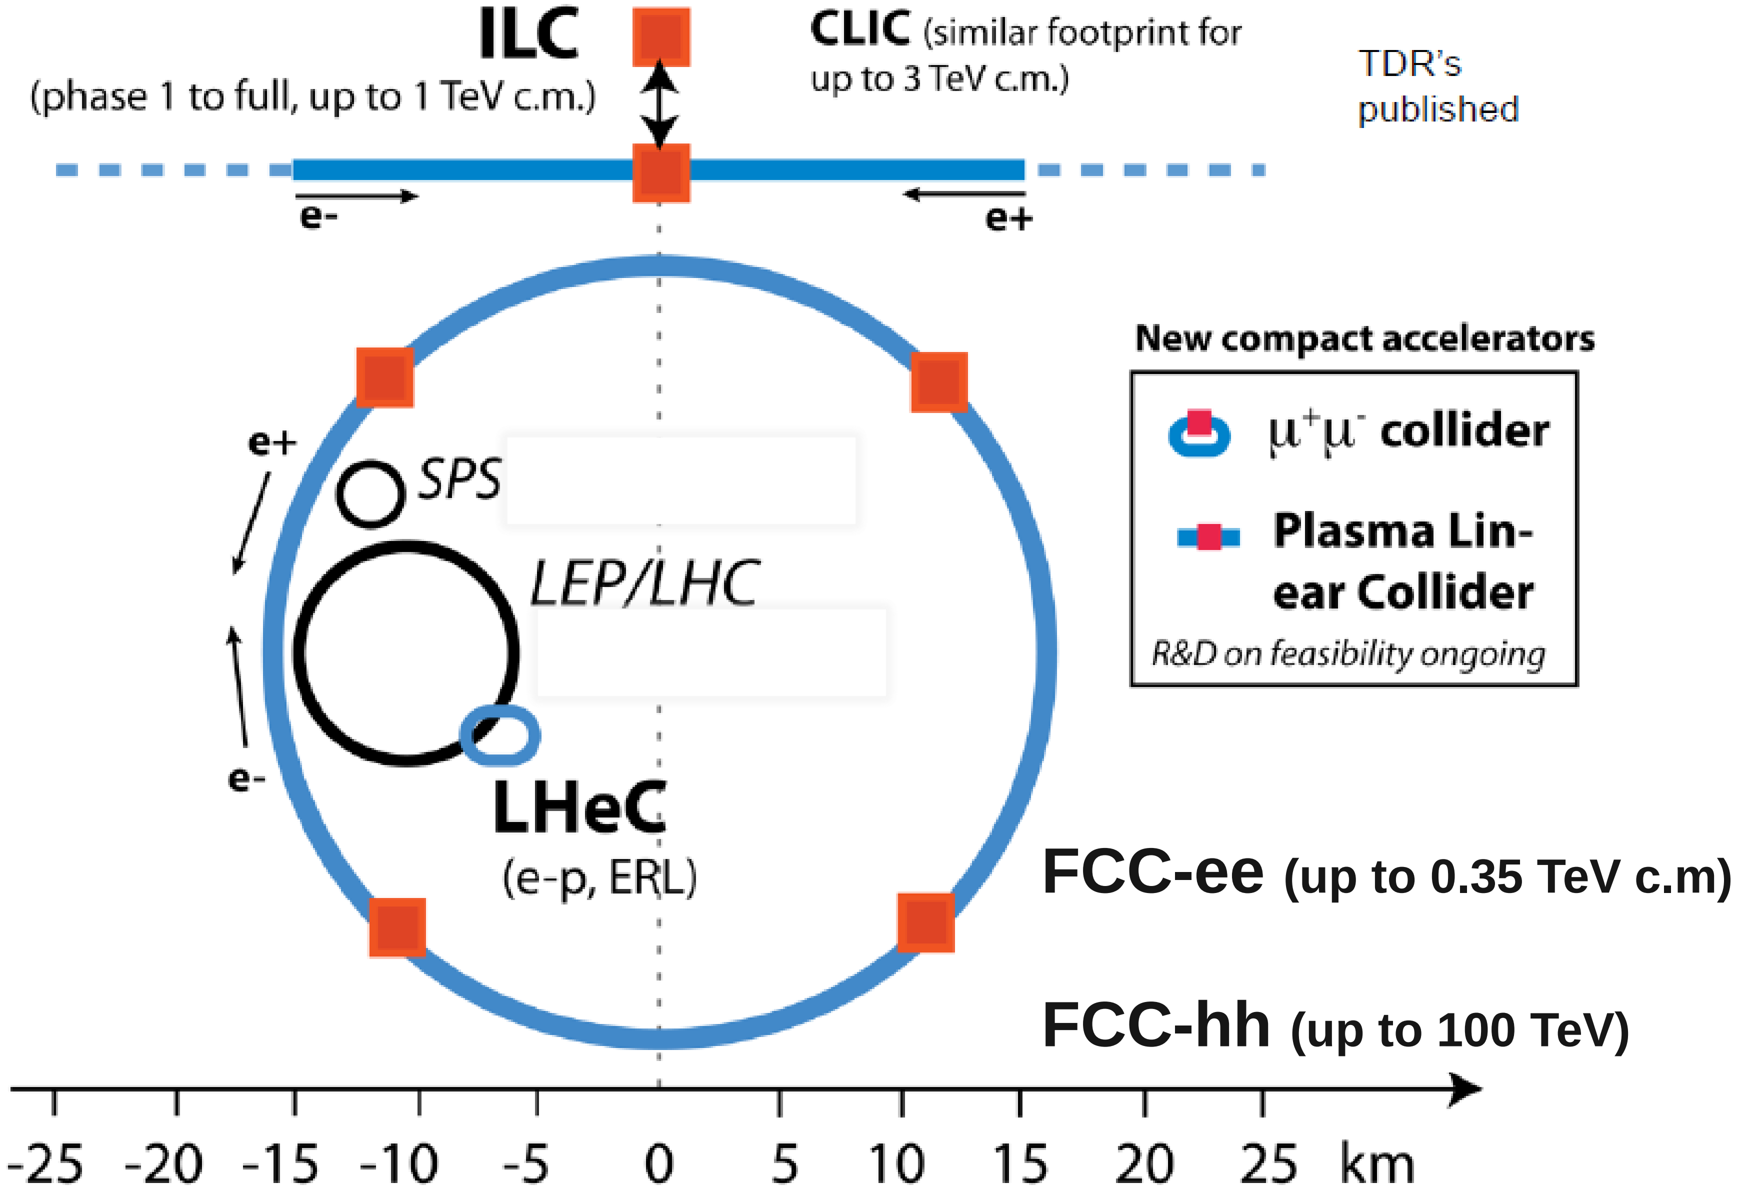
300 fb^{-1} before LS3

- HL-LHC : R&D => now an approved project with a kick-off meeting on 11th Nov. 2013

  A lot of technical and operation challenges :
  - Nb3Sn magnets (accelerator field quality) (HFM roadmap)
  - Collimators
  - Superconducting links
  - Crab cavities
  - Increased availability (machine protection,…)
  - …

  Accelerator-experiment interface are central:
  - Bunch spacing, pile-up density, crossing schemas, background, forward detectors, collimation,…

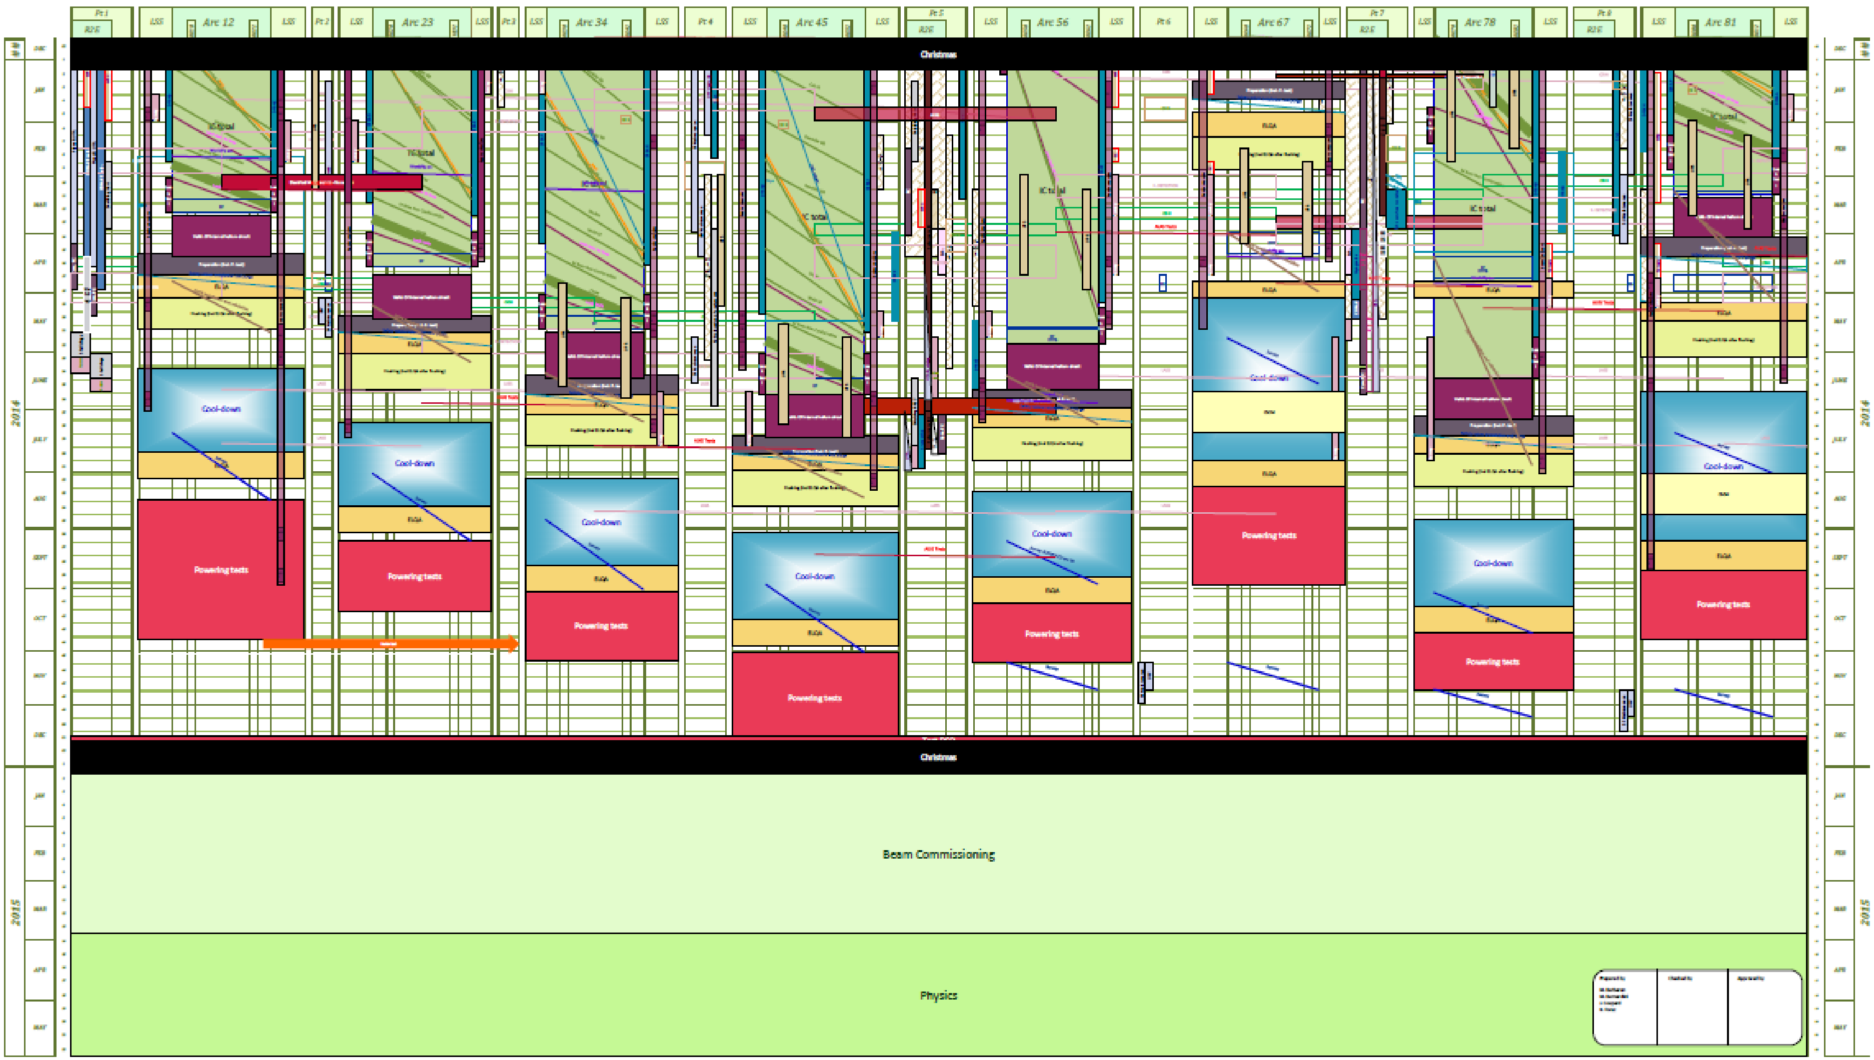
3000 fb^{-1} before 2035



Courtesy of Ralph Assmann

www.cern.ch

LS1 schedule in the LHC machine



Next Milestones: High Luminosity LHC

Jun. 2014: PDR (Preliminary Design Report) and re-baseline (costing, time) of the project

Sep. 2015: First short model QXF (inner triplet)

Nov. 2015: TDR and end of FP7 Design Study

Sep. 2016: First full size MQXF (long triplet Quad)

2016-17: Test Crab Cavities in SPS

Start Construction

LS2 (2018): Installation in LS2 of Cryogenics P4, SC horizontal link P7, 11 T dipole and DS collimators in P2, first Molybdenum collimators

LS3 (2022-23) : installation of all HL-LHC hardware synchronized with long detector shutdown
