Space Charge in Linear Machines

Massimo.Ferrario@LNF.INFN.IT

Relativistic equation of motion

$$\frac{d\mathbf{p}}{dt} = \mathbf{F} \qquad \mathbf{p} = \gamma m_o \mathbf{v} \qquad \beta = \frac{\mathbf{v}}{c} \qquad \gamma = \frac{1}{\sqrt{1 - \beta^2}} \qquad 1 + \beta^2 \gamma^2 = \gamma^2$$

$$\gamma m_o \frac{d\mathbf{v}}{dt} + m_o \mathbf{v} \frac{d\gamma}{dt} = \mathbf{F} \qquad \frac{d\gamma}{dt} = \frac{d}{dt} \left(1 - \frac{|\mathbf{v}|^2}{c^2} \right)^{-1/2} = \left(1 - \frac{|\mathbf{v}|^2}{c^2} \right)^{-3/2} \frac{\mathbf{v}}{c^2} \cdot \frac{d\mathbf{v}}{dt} = \gamma^3 \frac{\mathbf{v}}{c^2} \cdot \mathbf{a}$$

$$m_o \gamma \left(\mathbf{a} + \gamma^2 \frac{\mathbf{a} \cdot \mathbf{v}}{c^2} \mathbf{v} \right) = \mathbf{F}$$

$$\mathbf{a} = \frac{\mathbf{F} - (\mathbf{F} \cdot \boldsymbol{\beta}) \boldsymbol{\beta}}{\gamma m_{\circ}}$$
 Acceleration does not generally point in the direction of the applied force

$$\mathbf{F} \perp \mathbf{v} \qquad \mathbf{a}_{\perp} = \frac{\mathbf{F}_{\perp}}{\gamma m_o}$$

$$\mathbf{F} / / \mathbf{v} \qquad \mathbf{a}_{//} = \frac{\mathbf{F}_{//} \left(1 - \beta^2\right)}{\gamma m_o} = \frac{\mathbf{F}_{//}}{\gamma^3 m_o}$$

A moving body is more inert in the longitudinal direction than in the transverse direction

Relativistic equation of motion are coupled

$$\frac{d\boldsymbol{\beta}}{dt} = \frac{\mathbf{F} - (\mathbf{F} \cdot \boldsymbol{\beta})\boldsymbol{\beta}}{\gamma m_o c} \begin{cases} \frac{d\boldsymbol{\beta}_y}{dt} = \frac{1}{\gamma m_o} \\ \frac{d\boldsymbol{\beta}_z}{dt} = \frac{1}{\gamma m_o} \end{cases}$$

$$\frac{d\boldsymbol{\beta}}{dt} = \frac{\mathbf{F} - (\mathbf{F} \cdot \boldsymbol{\beta}) \boldsymbol{\beta}}{\gamma m_o c} \begin{cases}
\frac{d\beta_x}{dt} = \frac{1}{\gamma m_o c} \left[F_x - (F_x \beta_x + F_y \beta_y + F_z \beta_z) \beta_x \right] \\
\frac{d\beta_y}{dt} = \frac{1}{\gamma m_o c} \left[F_y - (F_x \beta_x + F_y \beta_y + F_z \beta_z) \beta_y \right] \\
\frac{d\beta_z}{dt} = \frac{1}{\gamma m_o c} \left[F_z - (F_x \beta_x + F_y \beta_y + F_z \beta_z) \beta_z \right]
\end{cases}$$

Relativistic equation of motion and paraxial approx.

$$\begin{cases}
\frac{d\beta_x}{dt} = \frac{1}{\gamma m_o c} \left[F_x - \left(F_x \beta_x + F_z \beta_z \right) \beta_x \right] \\
\frac{d\beta_z}{dt} = \frac{1}{\gamma m_o c} \left[F_z - \left(F_x \beta_x + F_z \beta_z \right) \beta_z \right]
\end{cases}$$

$$\begin{cases} \frac{d(x'\beta_z)}{dz} = \frac{1}{\beta_z \gamma m_o c^2} \left[F_x - \left(F_x x' \beta_z + F_z \beta_z \right) x' \beta_z \right] \\ \frac{d\beta_z}{dz} = \frac{1}{\beta_z \gamma m_o c^2} \left[F_z - \left(F_x x' \beta_z + F_z \beta_z \right) \beta_z \right] \end{cases}$$

$$x'' + \frac{F_z}{\beta_z \gamma m_o c^2} x' = \frac{F_x}{\beta_z \gamma m_o c^2}$$
$$F_z = \gamma' m_o c^2$$

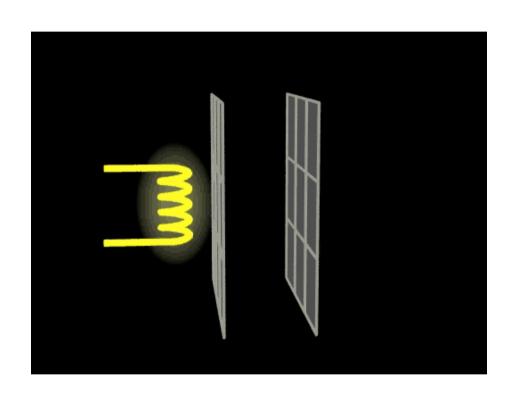

$$dz = v_z dt = c\beta_z dt$$

$$x' = \frac{dx}{dz} = \frac{\beta_x}{\beta_z}$$

$$\beta_x << \beta_z$$

$$x'' + \frac{\gamma'}{\beta_z \gamma} x' = \frac{F_x}{\beta_z \gamma m_o c^2}$$

Beam dynamics in a relativistic capacitor under the effect of gravity......free fall particles?

$$\begin{cases} F_z = eE_z \\ F_y = -\gamma m_o g \end{cases}$$

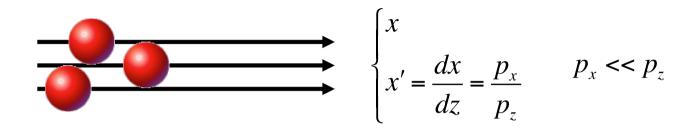

$$\begin{cases} \ddot{y} = \left[-g\left(1 - \beta_y^2\right) + \frac{1}{\gamma m_o} eE_z \left| \beta_y \right| \beta_z \right] \\ \ddot{z} = \left[\frac{1}{\gamma m_o} eE_z \left(1 - \beta_z^2\right) - g \left| \beta_y \right| \beta_z \right] \end{cases}$$

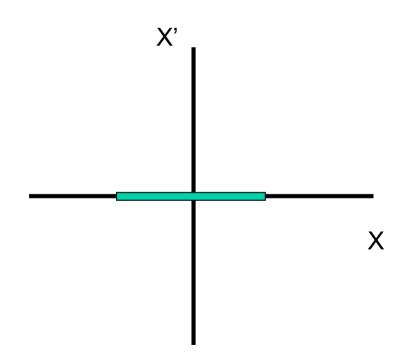

$$y'' + \frac{\gamma'}{\gamma}y' = -\frac{g}{c^2}$$

OUTLINE

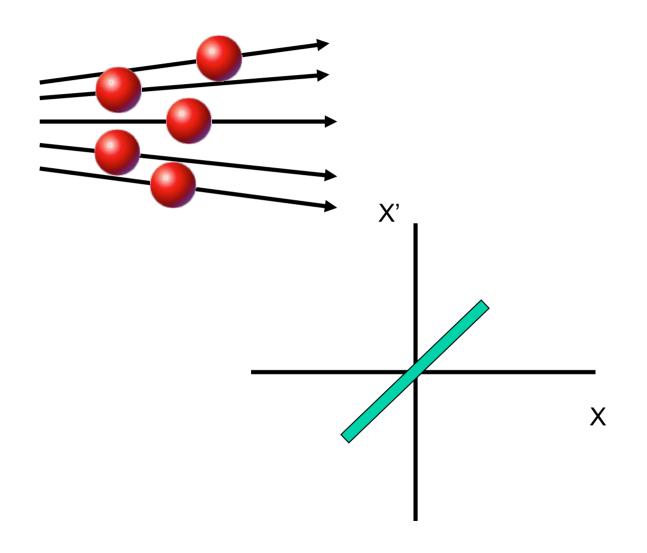

- The rms emittance concept
- rms envelope equation
- Space charge forces
- Space charge induced emittance oscillations
- Matching conditions and emittance compensation

Trace space of an ideal laminar beam

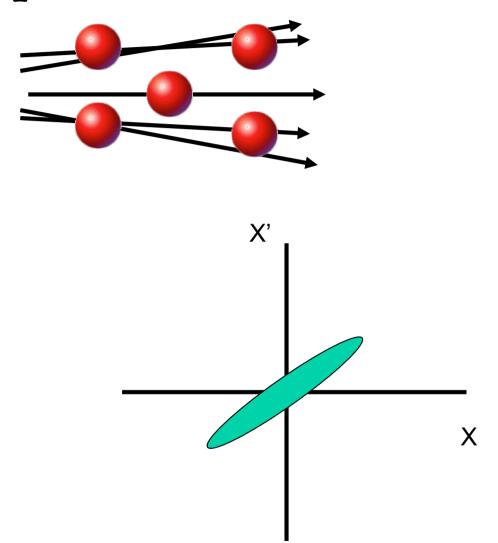

Trace space of a laminar beam

Trace space of non laminar beam

Geometric emittance:

Ellipse equation:
$$\gamma x^2 + 2\alpha x x' + \beta x'^2 = \varepsilon_g$$

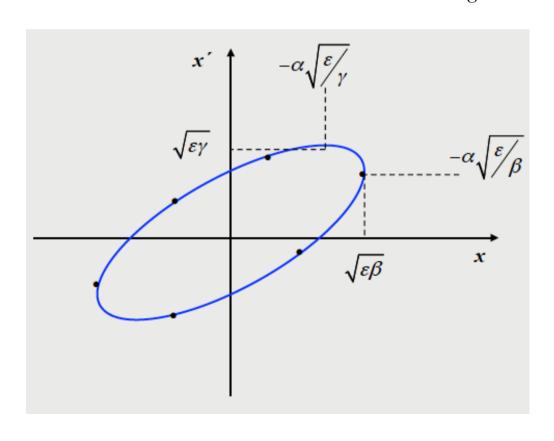

Twiss parameters: $\beta \gamma - \alpha^2 = 1$ $\beta' = -2\alpha$

$$\beta \gamma - \alpha^2 = 1$$

$$\beta' = -2\alpha$$

Ellipse area:

$$A = \pi \varepsilon_g$$

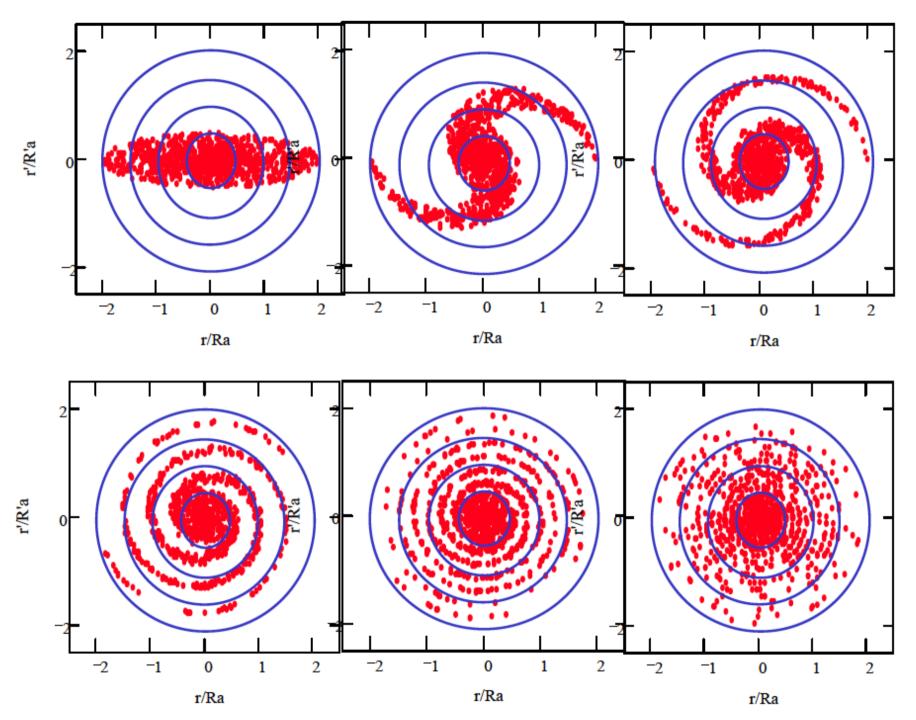

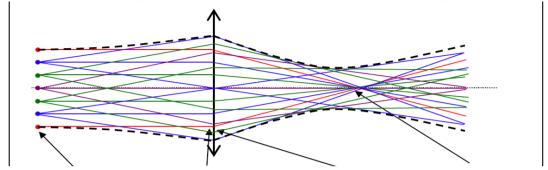

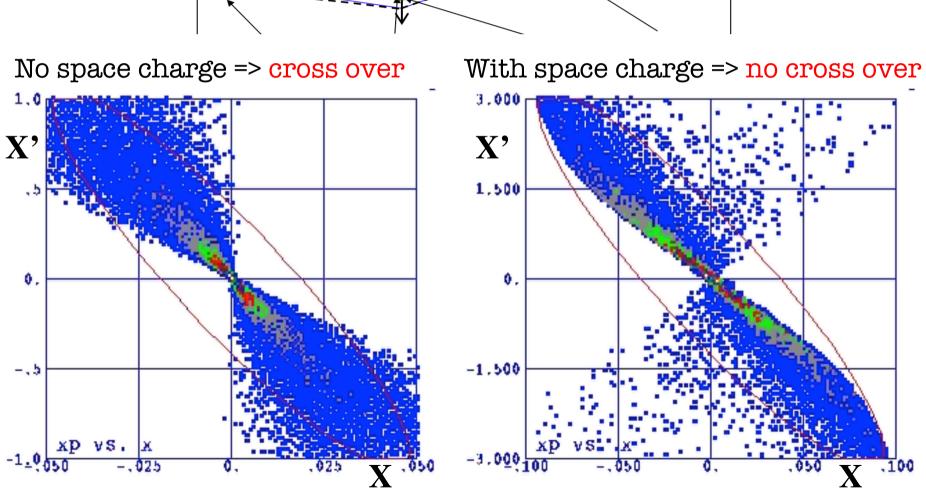

Fig. 17: Filamentation of mismatched beam in non-linear force

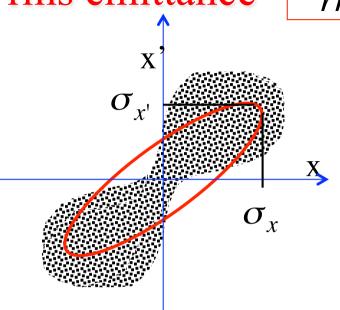

Trace space evolution

rms emittance

$$\int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} f(x, x') dx dx' = 1 \qquad f'(x, x') = 0$$

rms beam envelope:

$$\sigma_x^2 = \langle x^2 \rangle = \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} x^2 f(x, x') dx dx'$$

Define rms emittance:

$$\gamma x^2 + 2\alpha x x' + \beta x'^2 = \varepsilon_{rms}$$

such that:

$$\sigma_x = \sqrt{\langle x^2 \rangle} = \sqrt{\beta \varepsilon_{rms}}$$

$$\sigma_{x'} = \sqrt{\langle x'^2 \rangle} = \sqrt{\gamma \varepsilon_{rms}}$$

Since:

$$\alpha = -\frac{\beta'}{2}$$

$$\alpha = -\frac{\beta'}{2} \qquad \beta = \frac{\langle x^2 \rangle}{\varepsilon_{rms}}$$

it follows:
$$\alpha = -\frac{1}{2\varepsilon_{rms}} \frac{d}{dz} \langle x^2 \rangle = -\frac{\langle xx' \rangle}{\varepsilon_{rms}} = -\frac{\sigma_{xx'}}{\varepsilon_{rms}}$$

$$\sigma_{x} = \sqrt{\langle x^{2} \rangle} = \sqrt{\beta \varepsilon_{rms}}$$

$$\sigma_{x'} = \sqrt{\langle x^{'2} \rangle} = \sqrt{\gamma \varepsilon_{rms}}$$

$$\sigma_{xx'} = \langle xx' \rangle = -\alpha \varepsilon_{rms}$$

It holds also the relation:

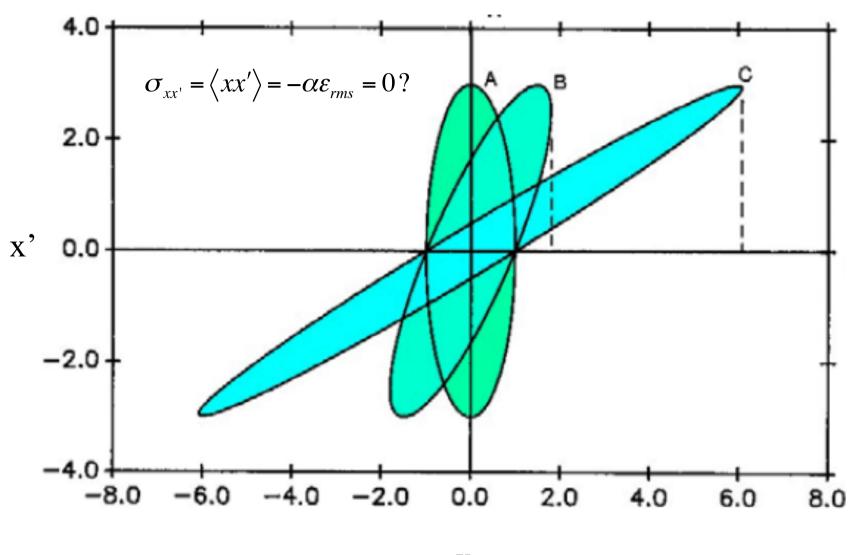

$$\gamma \beta - \alpha^2 = 1$$

Substituting
$$\alpha, \beta, \gamma$$
 we get $\frac{\sigma_{x'}^2}{\varepsilon_{rms}} \frac{\sigma_x^2}{\varepsilon_{rms}} - \left(\frac{\sigma_{xx'}}{\varepsilon_{rms}}\right)^2 = 1$

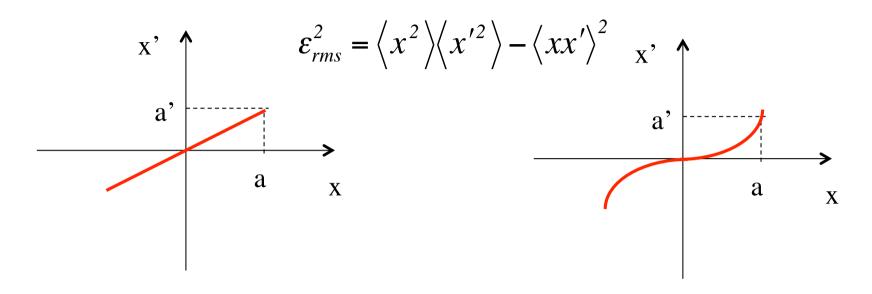

We end up with the definition of rms emittance in terms of the second moments of the distribution:

$$\varepsilon_{rms} = \sqrt{\sigma_x^2 \sigma_{x'}^2 - \sigma_{xx'}^2} = \sqrt{\left(\left\langle x^2 \right\rangle \left\langle x'^2 \right\rangle - \left\langle xx' \right\rangle^2\right)}$$

Which distribution has no correlations?

What does rms emittance tell us about phase space distributions under linear or non-linear forces acting on the beam?

Assuming a generic x, x' correlation of the type: $x' = Cx^n$

$$\varepsilon_{rms}^{2} = C^{2} \left(\left\langle x^{2} \right\rangle \left\langle x^{2n} \right\rangle - \left\langle x^{n+1} \right\rangle^{2} \right)$$
When $n = 1 = > \epsilon_{rms} = 0$
When $n \neq 1 = > \epsilon_{rms} \neq 0$

Constant under linear transformation only

$$\frac{\mathrm{d}}{\mathrm{d}z}\langle x^2\rangle\langle x'^2\rangle - \langle xx'\rangle^2 = 2\langle xx'\rangle\langle x'^2\rangle + 2\langle x^2\rangle\langle x'\rangle\langle x''\rangle - 2\langle xx''\rangle\langle xx'\rangle = 0$$

For linear transformations, $x'' = -k_x^2 x$, and the right-hand side of the equation is

$$2k_x^2\langle x^2\rangle\langle xx'\rangle - 2\langle x^2\rangle\langle xx'\rangle k_x^2 = 0,$$

SO

$$\frac{\mathrm{d}}{\mathrm{d}z}\langle x^2\rangle\langle x'^2\rangle - \langle xx'\rangle^2 = 0$$

And without acceleration:

$$x' = \frac{p_x}{p_z}$$

Normalized rms emittance: $\varepsilon_{n,rms}$

Canonical transverse momentum: $p_x = p_z x' = m_o c \beta \gamma x'$ $p_z \approx p$

$$\varepsilon_{n,rms} = \frac{1}{m_o c} \sqrt{\sigma_x^2 \sigma_{p_x}^2 - \sigma_{xp_x}^2} = \frac{1}{m_o c} \sqrt{\left(\left\langle x^2 \right\rangle \left\langle p_x^2 \right\rangle - \left\langle x p_x \right\rangle^2\right)} \approx \left(\beta \gamma \right) \varepsilon_{rms}$$

Liouville theorem: the density of particles n, or the volume V occupied by a given number of particles in phase space (x,p_x,y,p_y,z,p_z) remains invariant under conservative forces.

$$\frac{dn}{dt} = 0$$

It hold also in the projected phase spaces $(x,p_x),(y,p_y)(,z,p_z)$ provided that there are no couplings

Limit of single particle emittance

Limits are set by Quantum Mechanics on the knowledge of the two conjugate variables (x,p_x) . According to Heisenberg:

$$\sigma_x \sigma_{p_x} \ge \frac{\hbar}{2}$$

This limitation can be expressed by saying that the state of a particle is not exactly represented by a point, but by a small uncertainty volume of the order of \hbar^3 in the 6D phase space.

In particular for a single electron in 2D phase space it holds:

$$\varepsilon_{n,rms} = \frac{1}{m_o c} \sqrt{\sigma_x^2 \sigma_{p_x}^2 - \sigma_{xp_x}^2} \implies \begin{cases} = 0 & \text{classical limit} \\ \ge \frac{1}{2} \frac{\hbar}{m_o c} = \frac{\lambda_c}{2} = 1.9 \times 10^{-13} m & \text{quantum limit} \end{cases}$$

Where λ_c is the reduced Compton wavelength.

OUTLINE

- The rms emittance concept
- rms envelope equation
- Space charge forces
- Space charge induced emittance oscillations
- Matching conditions and emittance compensation

Envelope Equation without Acceleration

Now take the derivatives:

$$\frac{d\sigma_{x}}{dz} = \frac{d}{dz}\sqrt{\langle x^{2}\rangle} = \frac{1}{2\sigma_{x}}\frac{d}{dz}\langle x^{2}\rangle = \frac{1}{2\sigma_{x}}2\langle xx'\rangle = \frac{\sigma_{xx'}}{\sigma_{x}}$$

$$\frac{d^{2}\sigma_{x}}{dz^{2}} = \frac{d}{dz}\frac{\sigma_{xx'}}{\sigma_{x}} = \frac{1}{\sigma_{x}}\frac{d\sigma_{xx'}}{dz} - \frac{\sigma_{xx'}^{2}}{\sigma_{x}^{3}} = \frac{1}{\sigma_{x}}(\langle x'^{2}\rangle + \langle xx'\rangle) - \frac{\sigma_{xx'}^{2}}{\sigma_{x}^{3}} = \frac{\sigma_{x'}^{2} + \langle xx''\rangle}{\sigma_{x}} - \frac{\sigma_{xx'}^{2}}{\sigma_{x}^{3}}$$

And simplify:
$$\sigma_x'' = \frac{\sigma_x^2 \sigma_{x'}^2 - \sigma_{xx'}^2}{\sigma_x^3} + \frac{\langle xx'' \rangle}{\sigma_x} = \frac{\varepsilon_{rms}^2}{\sigma_x^3} + \frac{\langle xx'' \rangle}{\sigma_x}$$

We obtain the rms envelope equation in which the rms emittance enters as defocusing pressure like term.

$$\sigma_x'' - \frac{\langle xx'' \rangle}{\sigma_x} = \frac{\varepsilon_{rms}^2}{\sigma_x^3}$$

$$\frac{\varepsilon_{rms}^2}{\sigma_x^3} \approx \frac{T}{V} \approx P$$

Beam Thermodynamics

Kinetic theory of gases defines temperatures in each directions and global as:

$$k_B T_x = m \langle v_x^2 \rangle$$
 $T = \frac{1}{3} (T_x + T_y + T_z)$ $E_k = \frac{1}{2} m \langle v^2 \rangle = \frac{3}{2} k_B T$

Definition of beam temperature in analogy:

$$k_B T_{beam,x} = \gamma m_o \left\langle v_x^2 \right\rangle \qquad \left\langle v_x^2 \right\rangle = \beta^2 c^2 \left\langle x'^2 \right\rangle = \beta^2 c^2 \sigma_{x'}^2 = \beta^2 c^2 \frac{\varepsilon_{rms}^2}{\sigma_x^2} = \beta^2 c^2 \frac{\varepsilon_{rms}}{\beta_x}$$

We get:
$$k_B T_{beam,x} = \gamma m_o \langle v_x^2 \rangle = \gamma m_o \beta^2 c^2 \frac{\varepsilon_{rms}^2}{\sigma_x^2} = \gamma m_o \beta^2 c^2 \frac{\varepsilon_{rms}}{\beta_x}$$

$$P_{beam,x} = nk_B T_{beam,x} = n\gamma m_o \beta^2 c^2 \frac{\varepsilon_{rms}^2}{\sigma_x^2} = N_T \gamma m_o \beta^2 c^2 \frac{\varepsilon_{rms}^2}{\sigma_L \sigma_x^2}$$

$$k_B T_{beam,x} = \gamma m_o \beta^2 c^2 \frac{\varepsilon_{rms}}{\beta_x}$$

Property	Hot beam	Cold beam
ion mass (m _o)	heavy ion	light ion
ion energy (βγ)	high energy	low energy
beam emittance (ε)	large emittance	small emittance
lattice properties $(\gamma_{x,y} \approx 1/\beta_{x,y})$	strong focus (low β)	high β
phase space portrait	hot beam x	cold beam *'

Electron Cooling: Temperature relaxation by mixing a hot ion beam with co-moving cold (light) electron beam.

$$S = kN \log(\pi \varepsilon)$$

Envelope Equation with Linear Focusing

$$\sigma_x'' - \frac{\langle xx'' \rangle}{\sigma_x} = \frac{\varepsilon_{rms}^2}{\sigma_x^3}$$

Assuming that each particle is subject only to a linear focusing force, without acceleration: $x'' + k_x^2 x = 0$

take the average over the entire particle ensemble $\langle xx'' \rangle = -k_x^2 \langle x^2 \rangle$

$$\sigma_x'' + k_x^2 \sigma_x = \frac{\varepsilon_{rms}^2}{\sigma_x^3}$$

We obtain the rms envelope equation with a linear focusing force in which, unlike in the single particle equation of motion, the rms emittance enters as defocusing pressure like term.

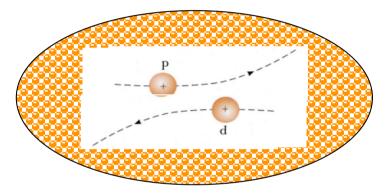

OUTLINE

- The rms emittance concept
- rms envelope equation
- Space charge forces
- Space charge induced emittance oscillations
- Matching conditions and emittance compensation

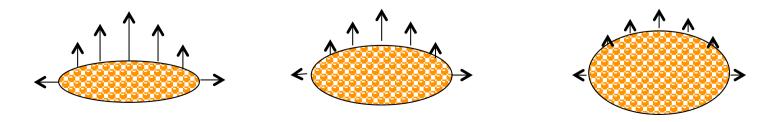

Space Charge: what does it mean?

The net effect of the **Coulomb** interactions in a multi-particle system can be classified into two regimes:

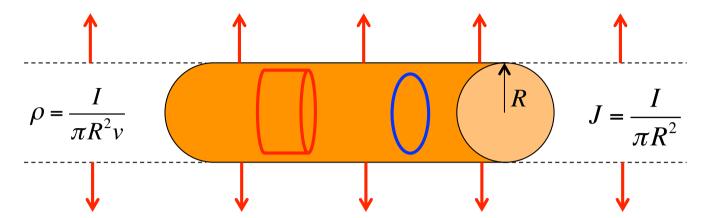

1) Collisional Regime ==> dominated by binary collisions caused by close particle encounters ==> Single Particle Effects

2) Space Charge Regime ==> dominated by the self field produced by the particle distribution, which varies appreciably only over large distances compare to the average separation of the particles ==> Collective Effects

Continuous Uniform Cylindrical Beam Model

Gauss's law

$$\int \varepsilon_o E \cdot dS = \int \rho dV$$

$$\int B \cdot dl = \mu_o \int J \cdot dS$$

$$E_r = \frac{I}{2\pi\varepsilon_o R^2 v} r \quad \text{for } r \le R$$

$$E_r = \frac{I}{2\pi\varepsilon_o v} \frac{1}{r} \quad \text{for } r > R$$

$$B_{\vartheta} = \mu_o \frac{Ir}{2\pi R^2} \quad \text{for} \quad r \le R$$

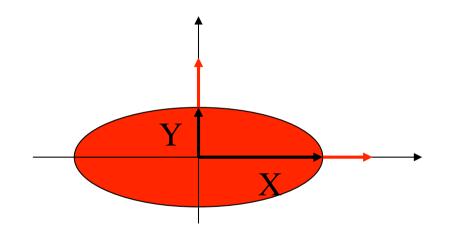

$$B_{\vartheta} = \mu_o \frac{I}{2\pi r} \quad \text{for} \quad r > R$$

$$B_{\vartheta} = \frac{\beta}{c} E_r$$

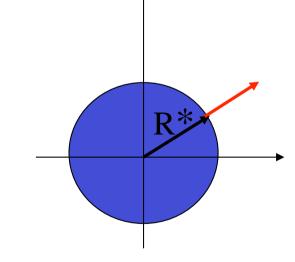

Elliptical cross section bunch

$$E_{y} = \frac{I}{\beta c \pi \varepsilon_{o}} \frac{y}{Y(X+Y)}$$

$$E_r = \frac{I}{2\beta c\pi\varepsilon_o R^2} r$$

$$R^* = \frac{X + Y}{2}$$

$$E_{x} = \frac{I}{\beta c \pi \varepsilon_{o}} \frac{x}{X(X+Y)}$$

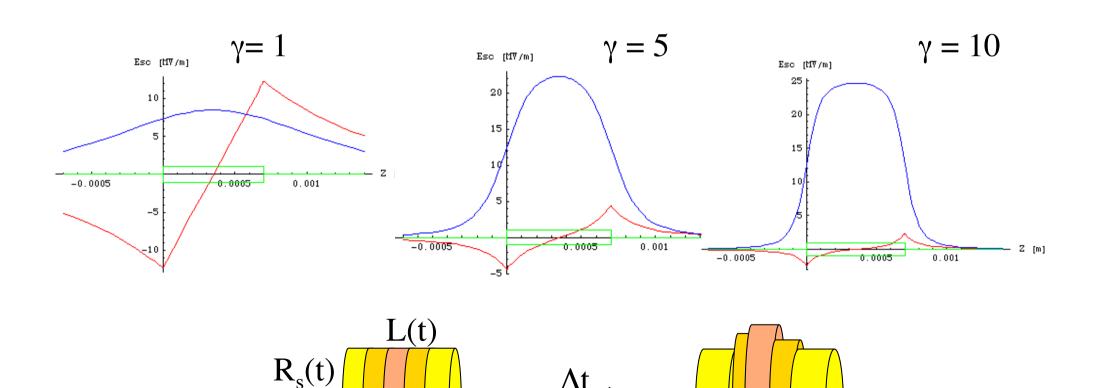

$$E_{x} = \frac{I}{\beta c \pi \varepsilon_{o}} \frac{x}{X(X+Y)}$$

$$E_{x}(X,z) = E_{y}(Y,z) = E_{r}(R^{*},z)$$

Bunched Uniform Cylindrical Beam Model

$$E_z(0, s, \gamma) = \frac{I}{2\pi\gamma\varepsilon_0 R^2 \beta c} h(s, \gamma)$$

$$E_r(r, s, \gamma) = \frac{Ir}{2\pi\varepsilon_0 R^2 \beta c} g(s, \gamma)$$

Lorentz Force

$$F_r = e(E_r - \beta c B_{\vartheta}) = e(1 - \beta^2) E_r = \frac{eE_r}{\gamma^2}$$

is a **linear** function of the transverse coordinate

$$\frac{dp_r}{dt} = F_r = \frac{eE_r}{\gamma^2} = \frac{eIr}{2\pi\gamma^2 \varepsilon_0 R^2 \beta c} g(s, \gamma)$$

The attractive magnetic force, which becomes significant at high velocities, tends to compensate for the repulsive electric force. Therefore space charge defocusing is primarily a non-relativistic effect. Using $R=2\sigma_x$ for a uniform distribution:

$$F_{x} = \frac{eIx}{8\pi\gamma^{2}\varepsilon_{0}\sigma_{x}^{2}\beta c}g(s,\gamma)$$

Envelope Equation with Space Charge

Single particle transverse motion:

$$\frac{dp_{x}}{dt} = F_{x} \qquad p_{x} = p \ x' = \beta \gamma m_{o} c x'$$

$$\frac{d}{dt} (px') = \beta c \frac{d}{dz} (p \ x') = F_{x}$$

$$x'' = \frac{F_x}{\beta cp}$$

$$F_{x} = \frac{eIx}{8\pi\gamma^{2}\varepsilon_{0}\sigma_{x}^{2}\beta c}g(s,\gamma)$$

$$x'' = \frac{k_{sc}(s, \gamma)}{\sigma_x^2} x$$

$$k_{sc} = \frac{2I}{I_A} g(s, \gamma)$$

$$I_A = \frac{4\pi\varepsilon_o m_o c^3}{e}$$

Now we can calculate the term $\langle xx'' \rangle$ that enters in the envelope equation

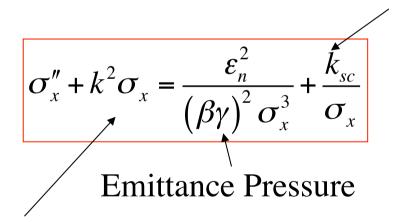

$$\sigma_{x}'' = \frac{\varepsilon_{rms}^{2}}{\sigma_{x}^{3}} + \frac{\langle xx'' \rangle}{\sigma_{x}}$$

$$x'' = \frac{k_{sc}}{\sigma_{x}^{2}} x$$

$$\langle xx'' \rangle = \frac{k_{sc}}{\sigma_{x}^{2}} \langle x^{2} \rangle = k_{sc}$$

Including all the other terms the envelope equation reads:

Space Charge De-focusing Force

External Focusing Forces

Laminarity Parameter:
$$\rho = \frac{(\beta \gamma)^2 k_{sc} \sigma_x^2}{\varepsilon_n^2}$$

The beam undergoes two regimes along the accelerator

$$\sigma_x'' + k^2 \sigma_x = \frac{\varepsilon_x^2}{(\beta \gamma)^2 \sigma_x^3} + \frac{k_{sc}}{\sigma_x}$$

 $\rho >> 1$

Laminar Beam

$$\sigma_x'' + k^2 \sigma_x = \frac{\varepsilon_n^2}{(\beta \gamma)^2 \sigma_x^3} + \frac{k_{sc}}{\sigma_x}$$

Neutral Plasma

Single Component Cold Relativistic Plasma

- Oscillations
- Instabilities
- EM Wave propagation

Magnetic focusing

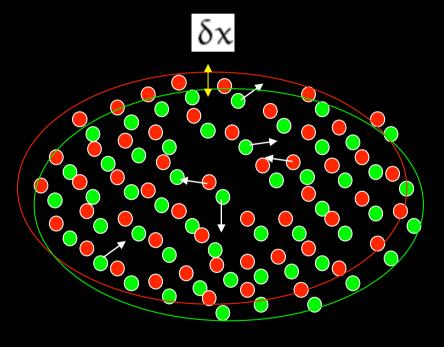

Magnetic focusing

Surface charge density

$$\sigma = e n \delta x$$

Surface electric field

$$E_x = -\sigma/\epsilon_0 = -e \, n \, \delta x/\epsilon_0$$

Restoring force

$$m\frac{d^2\delta x}{dt^2} = e E_x = -m \omega_p^2 \delta x$$

Plasma frequency

$$\omega_{\mathfrak{p}}^{2} = \frac{n e^{2}}{\epsilon_{0} m}$$

Plasma oscillations

$$\delta x = (\delta x)_0 \cos(\omega_p t)$$

$$\sigma'' + k_s^2 \sigma = \frac{k_{sc}(s, \gamma)}{\sigma}$$

Equilibrium solution:

$$\sigma_{eq}(s,\gamma) = \frac{\sqrt{k_{sc}(s,\gamma)}}{k_{s}}$$

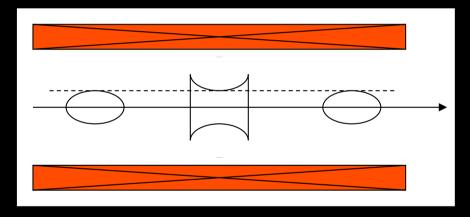

Small perturbation:

$$\sigma(\zeta) = \sigma_{eq}(s) + \delta\sigma(s)$$

$$\delta\sigma''(s) + 2k_s^2\delta\sigma(s) = 0$$

Single Component Relativistic Plasma

$$k_s = \frac{qB}{2mc\beta\gamma}$$

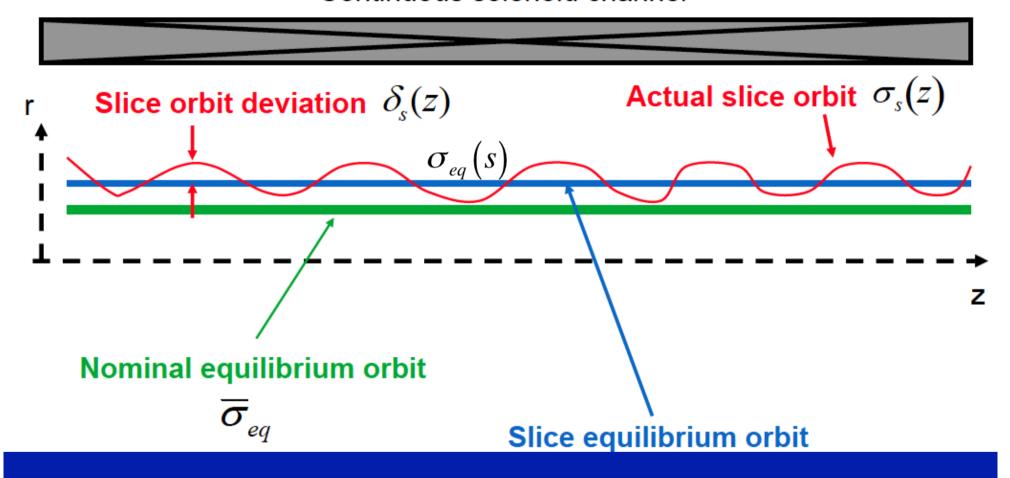

$$\delta\sigma(s) = \delta\sigma_o(s)\cos(\sqrt{2}k_s z)$$

Perturbed trajectories oscillate around the equilibrium with the same frequency but with different amplitudes:

$$\sigma(s) = \sigma_{eq}(s) + \delta\sigma_o(s)\cos(\sqrt{2}k_s z)$$

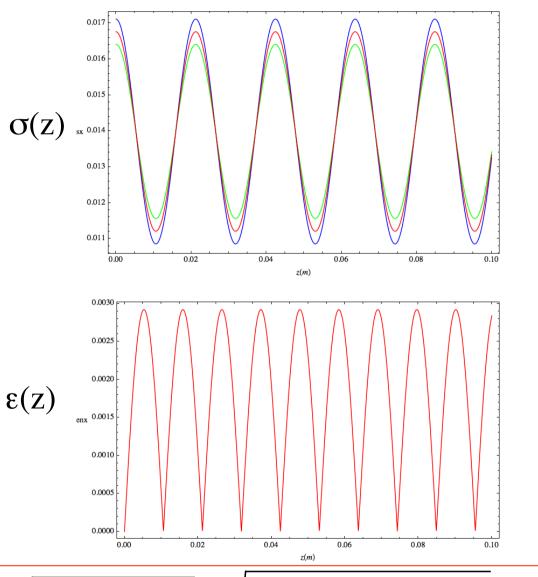

Continuous solenoid channel

Perturbed trajectories oscillate around the equilibrium with the same frequency but with different amplitudes:

$$\sigma(s) = \sigma_{eq}(s) + \delta\sigma_{o}(s)\cos(\sqrt{2}k_{s}z)$$

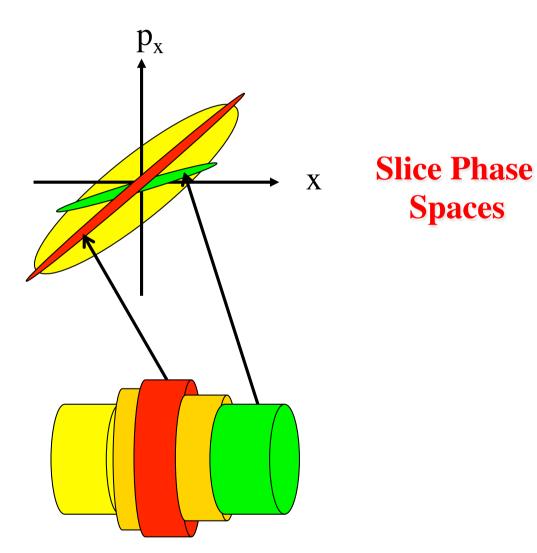

Envelope oscillations drive Emittance oscillations

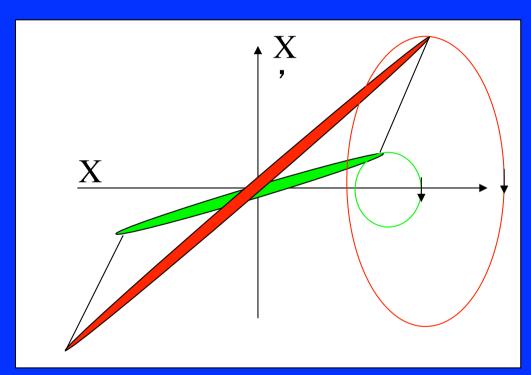

$$\varepsilon_{rms} = \sqrt{\sigma_x^2 \sigma_{x'}^2 - \sigma_{xx'}^2} = \sqrt{\left(\left\langle x^2 \right\rangle \left\langle x'^2 \right\rangle - \left\langle xx' \right\rangle^2\right)} \approx \left| sin(\sqrt{2}k_s z) \right|$$

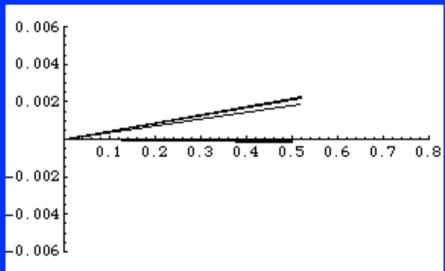

Emittance Oscillations are driven by space charge differential defocusing in core and tails of the beam

Projected Phase Space

Perturbed trajectories oscillate around the equilibrium with the same frequency but with different amplitudes

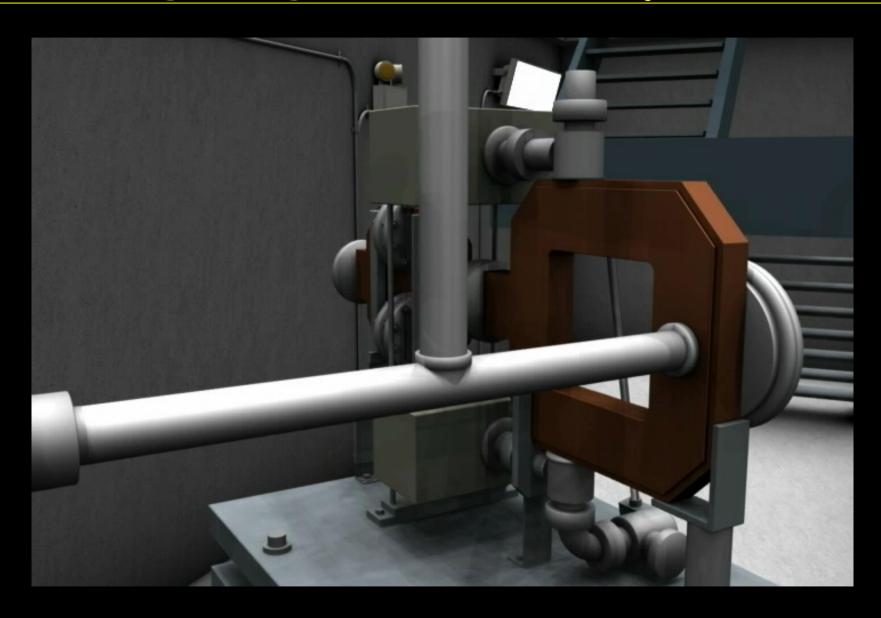

OUTLINE

- The rms emittance concept
- rms envelope equation
- Space charge forces
- Space charge induced emittance oscillations
- Matching conditions and emittance compensation

High Brightness Photo-Injector

Envelope Equation with Acceleration

$$\frac{dp_x}{dt} = \frac{d}{dt}(px') = \beta c \frac{d}{dz}(px') = 0$$

$$x'' + \frac{p'}{p}x' = 0$$

$$x'' = -\frac{(\beta \gamma)}{\beta \gamma}$$

$$p = \beta \gamma m_o c$$

$$\sigma_x'' = \frac{\varepsilon_{rms}^2}{\sigma_x^3} + \frac{\langle xx'' \rangle}{\sigma_x}$$

$$\langle xx'' \rangle = -\frac{(\beta \gamma)'}{\beta \gamma} \langle xx' \rangle = -\frac{(\beta \gamma)'}{\beta \gamma} \sigma_{xx'} = -\frac{(\beta \gamma)'}{\beta \gamma} \sigma_{x} \sigma_{x}'$$

Space Charge De-focusing Force

$$\sigma_x'' + \frac{(\beta \gamma)'}{\beta \gamma_x} \sigma_x' + k^2 \sigma_x = \frac{\varepsilon_n^2}{(\beta \gamma)^2 \sigma_x^3} + \frac{k_{sc}}{\sigma_x}$$

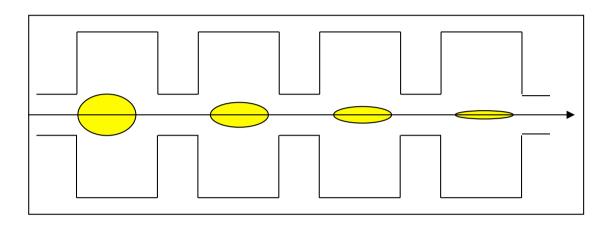

Adiabatic Damping

Emittance Pressure

Other External Focusing Forces

$$\varepsilon_n = \beta \gamma \varepsilon_{rms}$$

Beam subject to strong acceleration

$$\sigma_x'' + \frac{\gamma'}{\gamma}\sigma_x' + \frac{k_{RF}^2}{\gamma^2}\sigma_x = \frac{\varepsilon_n^2}{\gamma^2\sigma_x^3} + \frac{k_{sc}^o}{\gamma^3\sigma_x}$$

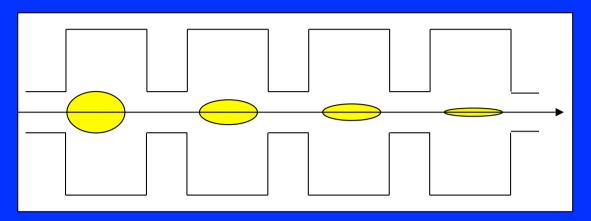

We must include also the RF focusing force:

$$k_{RF}^2 = \frac{{\gamma'}^2}{2}$$

$$k_{sc}^{o} = \frac{2I}{I_A} g(s, \gamma)$$

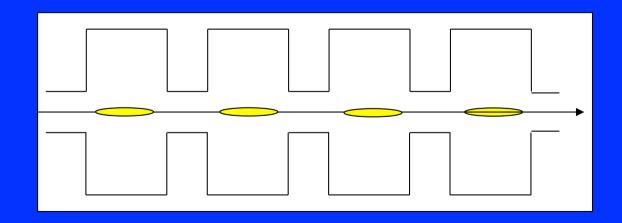

Space charge dominated beam (Laminar)

$$\sigma_q = \frac{1}{\gamma'} \sqrt{\frac{2I}{I_A \gamma}}$$

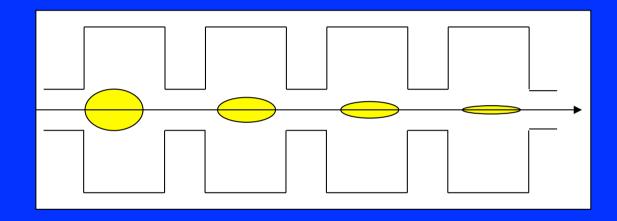

Emittance dominated beam (Thermal)

$$\sigma_{\varepsilon} = \sqrt{\frac{2\varepsilon_n}{\gamma'}}$$

$$\sigma_q = \frac{1}{\gamma'} \sqrt{\frac{2I}{I_A \gamma}}$$

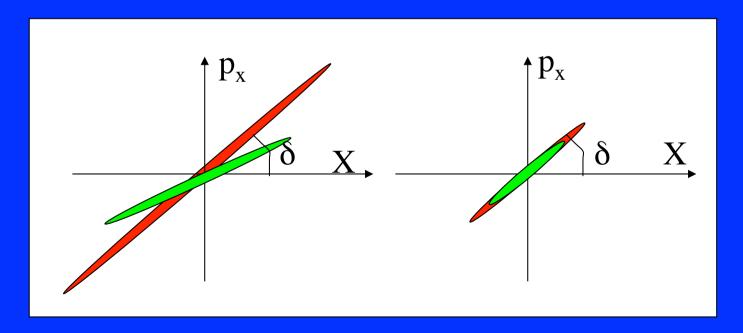

This solution represents a beam equilibrium mode that turns out to be the transport mode for achieving minimum emittance at the end of the emittance correction process

An important property of the laminar beam

$$\sigma_q = \frac{1}{\gamma'} \sqrt{\frac{2I}{I_A \gamma}}$$

$$\sigma_q' = -\sqrt{\frac{2I}{I_A \gamma^3}}$$

Constant phase space angle:
$$\delta = \frac{\gamma \sigma_q'}{\sigma_q} = -\frac{\gamma'}{2}$$

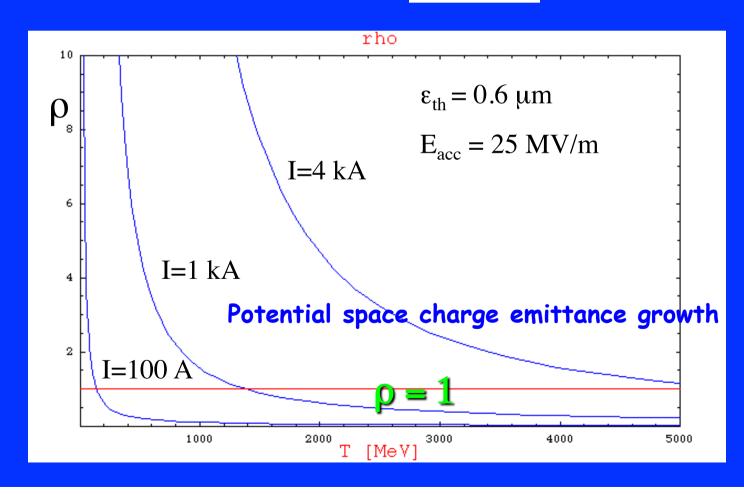

Laminarity parameter

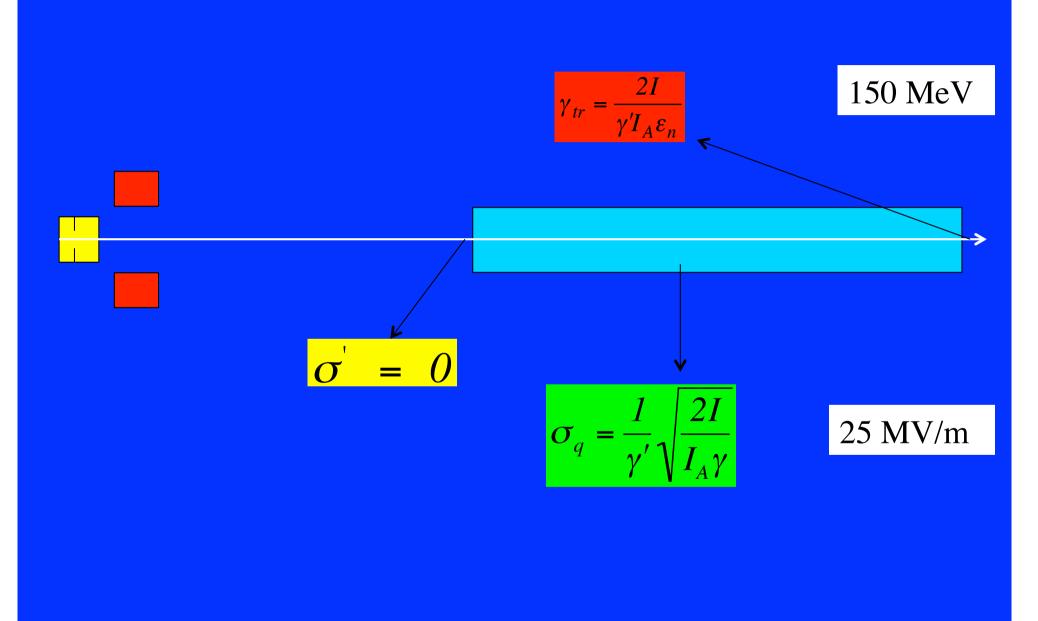

$$\rho = \frac{2I\sigma^2}{\gamma I_A \varepsilon_n^2} \equiv \frac{2I\sigma_q^2}{\gamma I_A \varepsilon_n^2} = \frac{4I^2}{\gamma'^2 I_A^2 \varepsilon_n^2 \gamma^2}$$

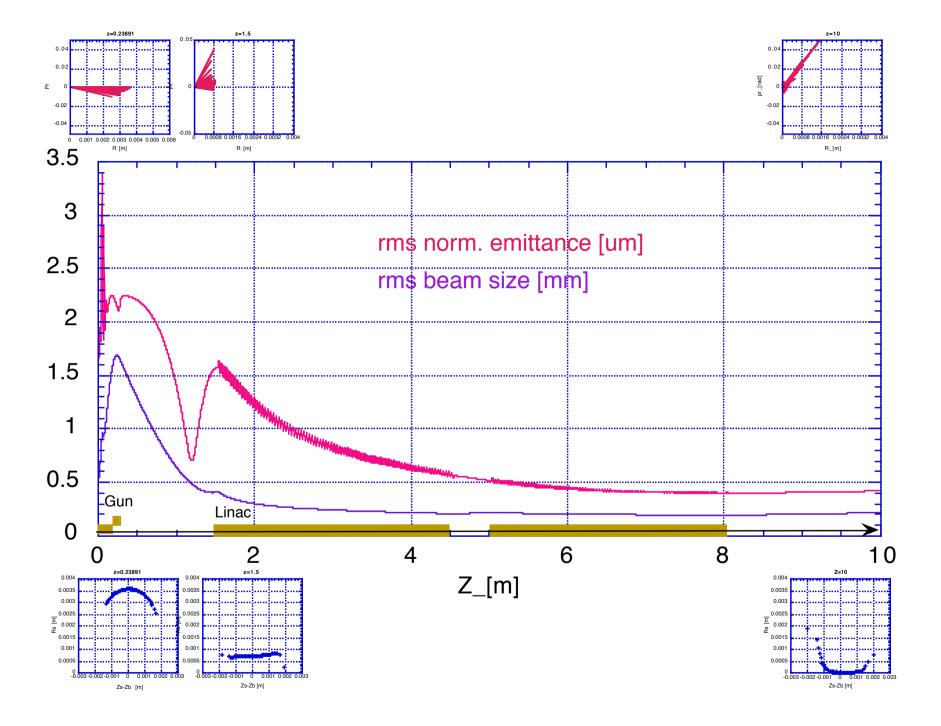

Transition Energy (p=1)

$$\gamma_{tr} = \frac{2I}{\gamma' I_A \varepsilon_n}$$

Matching Conditions with a TW Linac

Emittance Compensation for a SC dominated beam: Controlled Damping of Plasma Oscillations

- ε_n oscillations are driven by Space Charge
- * propagation close to the laminar solution allows control of ϵ_{n} oscillation "phase"
- \bullet ϵ_n sensitive to SC up to the transition energy
