... waiting for accelerators ... 1940: 2.3 MeV betatron,Kerst, Serber

Maxwell equations (poetry)

War es ein Gott, der diese Zeichen schrieb Die mit geheimnisvoll verborg 'nem Trieb Die Kräfte der Natur um mich enthüllen Und mir das Herz mit stiller Freude füllen. Ludwig Boltzman

> Was it a God whose inspiration Led him to write these fine equations Nature's fields to me he shows And so my heart with pleasure glows. translated by John P. Blewett

THEORETICAL UNDERSTANDING \rightarrow

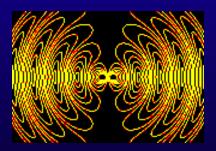

1873 Maxwell's equations

 \rightarrow made evident that changing charge densities would result in electric fields that would radiate outward

1887 Heinrich Hertz demonstrated such waves:

..... this is of no use whatsoever !

1898 Liénard:

ELECTRIC AND MAGNETIC FIELDS PRODUCED BY A POINT CHARGE MOVING ON AN ARBITRARY PATH

(by means of retarded potentials

proposed first by Ludwig Lorenz in 1867)

L'Éclairage Électrique

CHAMP ÉLECTRIQUE ET MAGNÉTIOUE

PRODUIT PAR UNE CHARGE ÉLECTRIQUE CONCENTRÉE EN UN POINT ET ANIMÉE D'UN MOUVEMENT QUELCONQUE

(2)

(3)

(4)

Admettons qu'une masse électrique en mouvement de densité p et de vitesse u en chaque point produit le mème champ qu'un courant de conduction d'intensité us. En conservant les notations d'un précédent article (1) nous obtiendrons pour déterminer le champ, les équations

$$\frac{1}{4\pi} \left(\frac{d\gamma}{dy} - \frac{d3}{d\tau} \right) = \beta u_x + \frac{df}{dt}$$
(1)
$$V^t \left(\frac{dh}{dy} - \frac{dg}{d\tau} \right) = -\frac{1}{4\pi} \frac{dx}{dt}$$
(2)

avec les analogues déduites par permutation tournante et en outre les suivantes

$$s = \left(\frac{df}{dx} + \frac{dg}{dy} + \frac{dh}{dy^2}\right)$$
$$\frac{dz}{dx} + \frac{d\beta}{dy^2} + \frac{d\gamma}{dy^2} = 0.$$

De ce système d'équations on déduit facilement les relations

(1) La théorie de Lorentz, L'Éclairage Électrique, t. XIV, P- 417. a, 3, 7, sont les composantes de la force magnétique et f. g. b, celles du déplacement dans l'éther.

Soient maintenant quatre fonctions 4, F, G, H definies par les conditions

$$\begin{pmatrix} \nabla^{4} \Delta - \frac{d^{4}}{dt^{2}} \end{pmatrix} \psi = -4\pi \nabla^{2} \rho.$$

$$(7)$$

$$\nabla^{3} \Delta - \frac{d^{2}}{dt^{2}} \end{pmatrix} F = -4\pi \nabla^{2} 2\mu_{F}$$

$$\begin{pmatrix} dt^2 \\ \left(V^2 \Delta - \frac{d^2}{dt^2} \right) G = -4\pi z u_Y \\ \left(V^2 \Delta - \frac{d^2}{dt^2} \right) H = -4\pi V^4 z u_Y$$
(8)

On satisfera aux conditions (5) et (6) en prenant

$$4\pi f = -\frac{d\cdot \psi}{dx} - \frac{1}{\nabla^2} \frac{dF}{dt}$$
(9)
$$\frac{d\Pi}{dG} = \frac{dG}{dG}$$

$$a = \frac{d_1}{d_1} - \frac{d_2}{d_1}.$$
 (10)

Quant aux équations (1) à (4), pour qu'elles soient satisfaites, il faudra que, en plus de (7) et (8), on ait la condition

$$\frac{d\frac{d}{dt}}{dt} + \frac{dF}{dx} + \frac{dG}{dy} + \frac{dH}{dt} = 0.$$
(11)

Occupons-nous d'abord de l'équation (7). On sait que la solution la plus générale est la suivante :

$$\psi = \int \frac{\varphi \left[x', y', \zeta, t - \frac{r}{\nabla} \right]}{r} \, d\omega' \tag{12}$$

Storage ring based synchrotron light source

Why do they radiate?

Bremsstrahlung or "braking" radiation

Liénard-Wiechert potentials

$$\varphi(\mathbf{t}) = \frac{1}{4\pi\varepsilon_0} \frac{\mathbf{q}}{\left[\mathbf{r}(1-\mathbf{\vec{n}}\cdot\mathbf{\vec{\beta}})\right]_{ret}} \qquad \qquad \mathbf{\vec{A}}(\mathbf{t}) = \frac{\mathbf{q}}{4\pi\varepsilon_0} \mathbf{c}^2 \left[\frac{\mathbf{v}}{\mathbf{r}(1-\mathbf{\vec{n}}\cdot\mathbf{\vec{\beta}})}\right]_{ret}$$

and the electromagnetic fields:

$$\nabla \cdot \vec{\mathbf{A}} + \frac{1}{c^2} \frac{\partial \phi}{\partial t} = 0 \qquad \text{(Lorentz gauge)}$$
$$\vec{\mathbf{B}} = \nabla \times \vec{\mathbf{A}}$$
$$\vec{\mathbf{E}} = -\nabla \phi - \frac{\partial \vec{\mathbf{A}}}{\partial t}$$

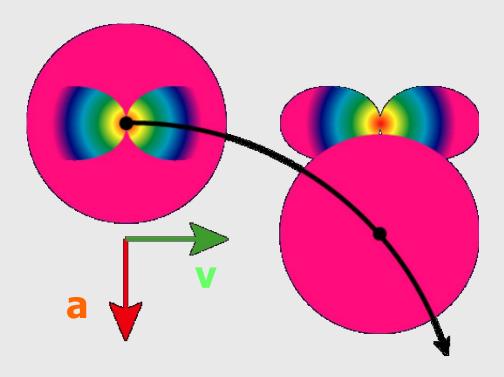

Fields of a moving charge

$$\vec{\mathbf{E}}(t) = \frac{q}{4\pi\varepsilon_0} \left[\frac{\vec{\mathbf{n}} - \vec{\beta}}{\left(1 - \vec{\mathbf{n}} \cdot \vec{\beta}\right)^3 \gamma^2} \cdot \frac{1}{|\mathbf{r}|^2} \right]_{ret} +$$

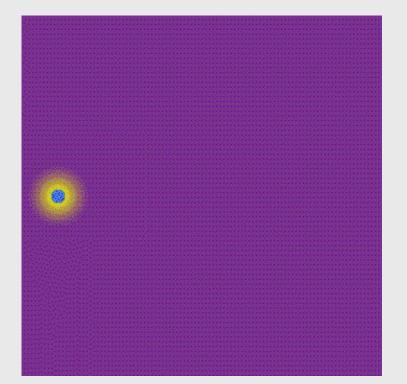

$$\frac{q}{4\pi\varepsilon_0 c} \left[\frac{\vec{\mathbf{n}} \times \left[\left(\vec{\mathbf{n}} - \vec{\beta} \right) \times \vec{\beta} \right]}{\left(1 - \vec{\mathbf{n}} \cdot \vec{\beta} \right)^3 \gamma^2} \cdot \frac{\mathbf{1}}{\mathbf{r}} \right]_{ret}$$

$$\vec{\mathbf{B}}(t) = \frac{1}{c} [\vec{\mathbf{n}} \times \vec{\mathbf{E}}]$$

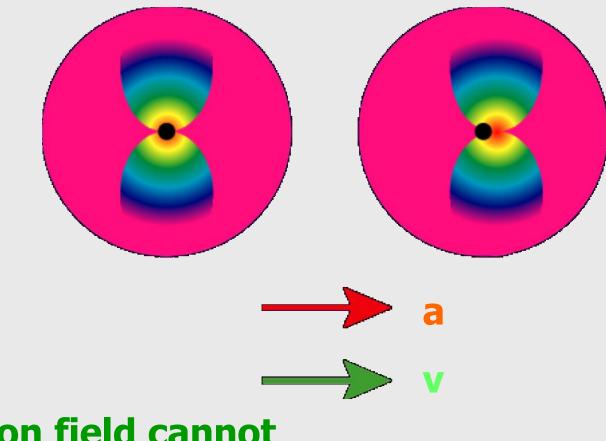

Transverse acceleration

Radiation field quickly separates itself from the Coulomb field

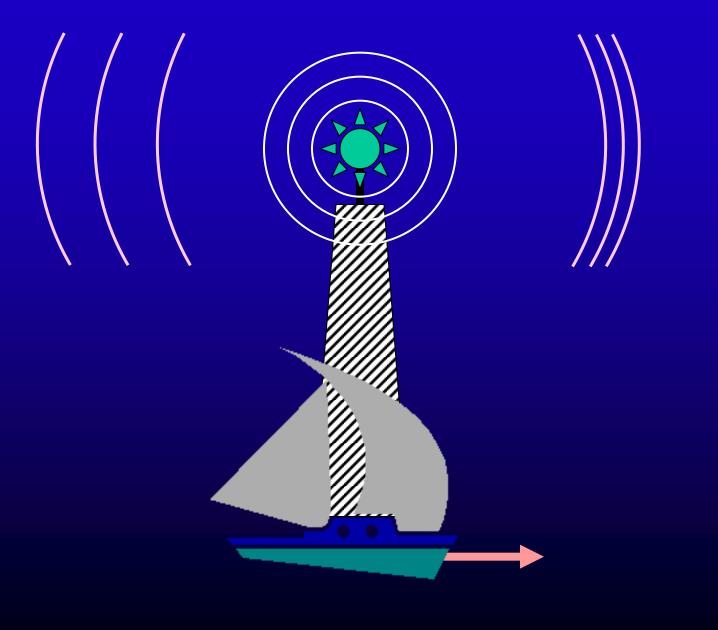

Longitudinal acceleration

Radiation field cannot separate itself from the Coulomb field

Moving Source of Waves

Time compression

Electron with velocity β emits a wave with period T_{emit} while the observer sees a different period T_{obs} because the electron was moving towards the observer

The wavelength is shortened by the same factor

n

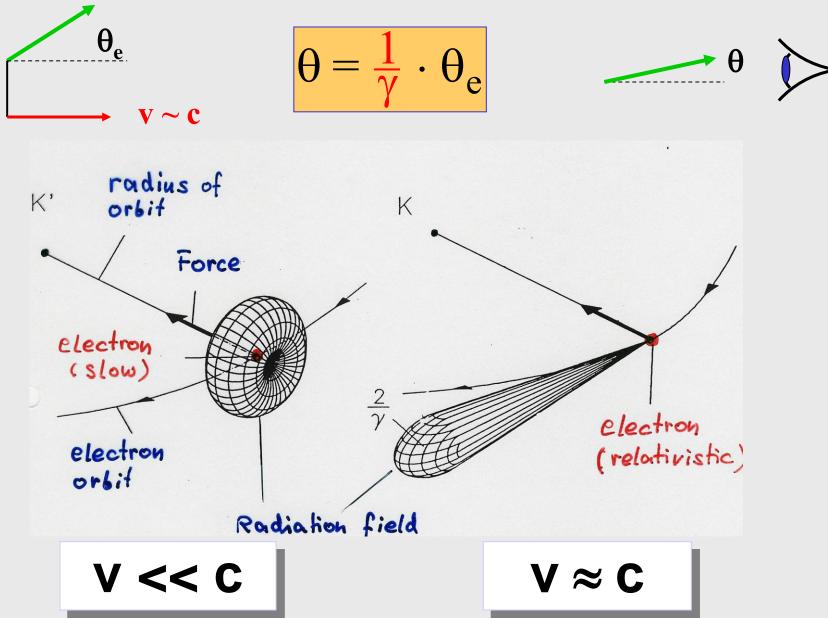

θ

 $\lambda_{obs} = (1 - \beta \cos \theta) \lambda_{emit}$ in ultra-relativistic case, looking along a tangent to the trajectory

$$\lambda_{\text{obs}} = \frac{1}{2\gamma^2} \lambda_{\text{emit}}$$
 since $1 - \beta = \frac{1 - \beta^2}{1 + \beta} \cong \frac{1}{2\gamma^2}$

 $T_{obs} = (1 - \mathbf{n} \cdot \boldsymbol{\beta}) T_{emit}$

Radiation is emitted into a narrow cone

Sound waves (non-relativistic)

Angular collimation

Doppler effect (moving source of sound)

$$\lambda_{heard} = \lambda_{emitted} \left(1 - \frac{\mathbf{v}}{\mathbf{v}_s} \right)$$

Synchrotron radiation power

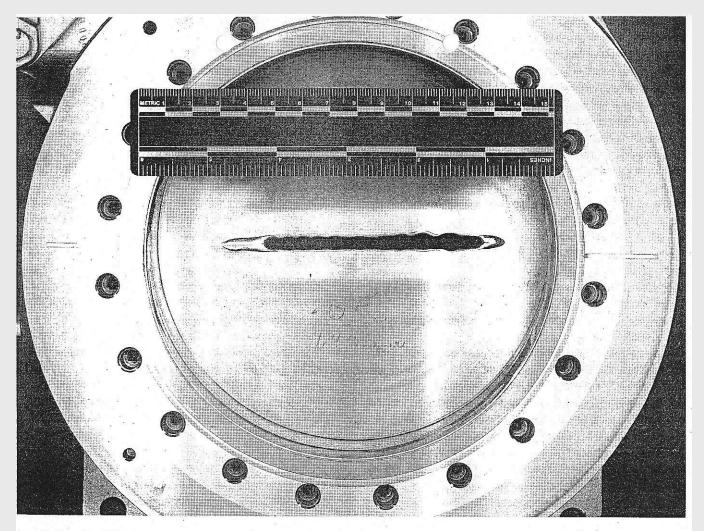

Power emitted is proportional to:

$$P_{\gamma} = \frac{cC_{\gamma}}{2\pi} \cdot \frac{E^4}{\rho^2}$$

$$C_{\gamma} = \frac{4\pi}{3} \frac{r_e}{(m_e c^2)^3} = 8.858 \cdot 10^{-5} \left[\frac{\text{m}}{\text{GeV}^3}\right]$$

The power is all too real!

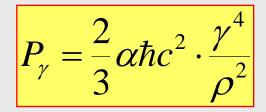

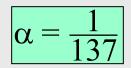

ig. 12. Damaged X-ray ring front end gate valve. The power incident on the valve was approximately 1 kW for a duration estimated to 2-10 min and drilled a hole through the valve plate.

Synchrotron radiation power

Power emitted is proportional to:

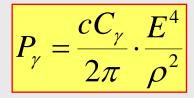

$$U_0 = \frac{4\pi}{3} \alpha \hbar c \frac{\gamma^4}{\rho}$$

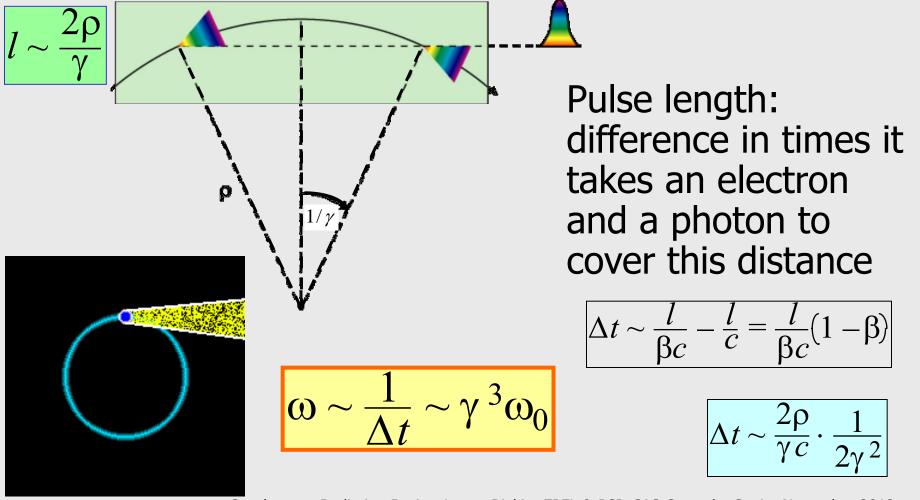

$$C_{\gamma} = \frac{4\pi}{3} \frac{r_e}{(m_e c^2)^3} = 8.858 \cdot 10^{-5} \left[\frac{\mathrm{m}}{\mathrm{GeV}^3}\right]$$

Energy loss per turn:

$$U_0 = C_{\gamma} \cdot \frac{E^4}{\rho}$$

Typical frequency of synchrotron light

Due to extreme collimation of light observer sees only a small portion of electron trajectory (a few mm)

Spectrum of synchrotron radiation

• Synchrotron light comes in a series of flashes every T_0 (revolution period)

 the spectrum consists of harmonics of

$$\omega_0 = \frac{1}{T_0}$$

 flashes are extremely short: harmonics reach up to very high frequencies

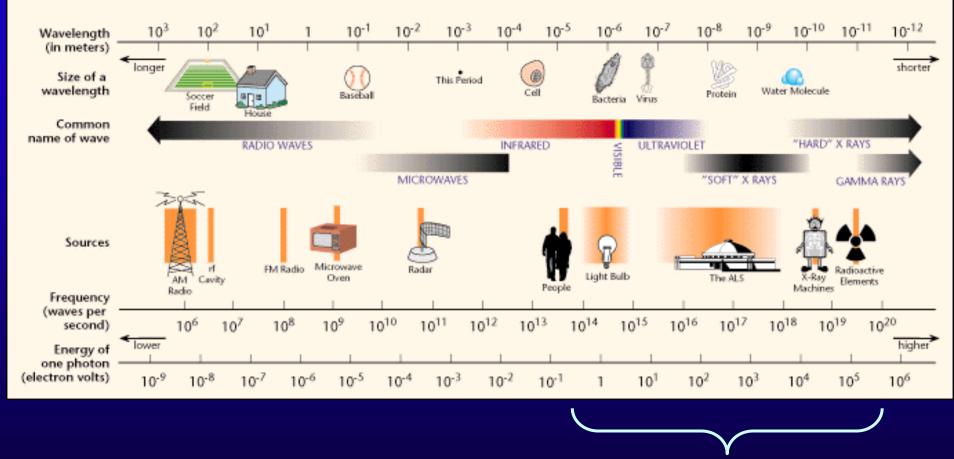

$$\omega_{typ} \cong \gamma^3 \omega_0$$

 $\omega_0 \sim 1 \text{ MHz}$ $\gamma \sim 4000$ $\omega_{\text{typ}} \sim 10^{16} \text{ Hz }!$

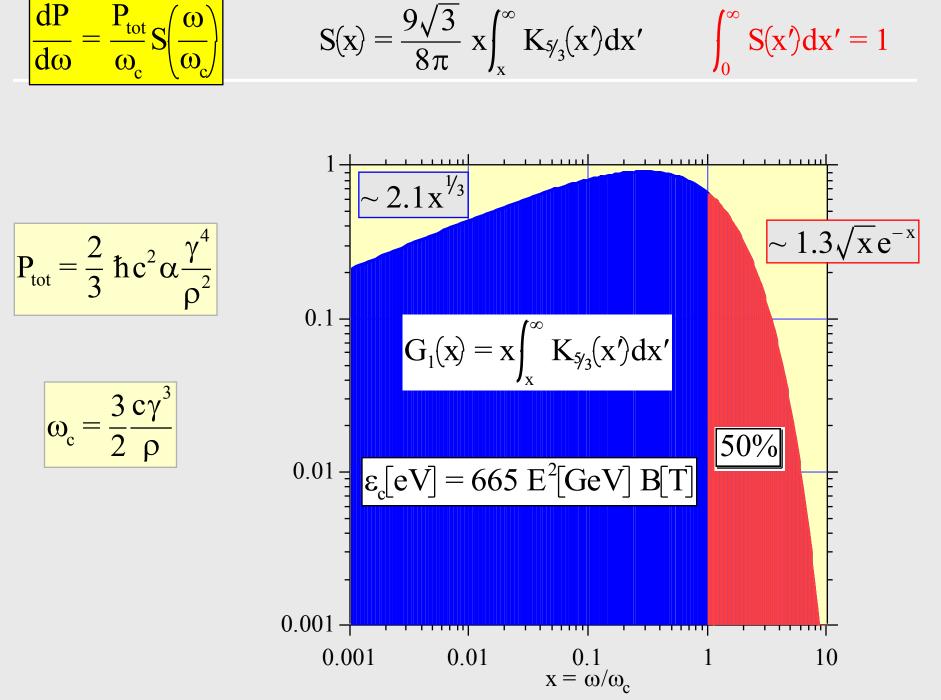

• At high frequencies the individual harmonics overlap

continuous spectrum !

THE ELECTROMAGNETIC SPECTRUM

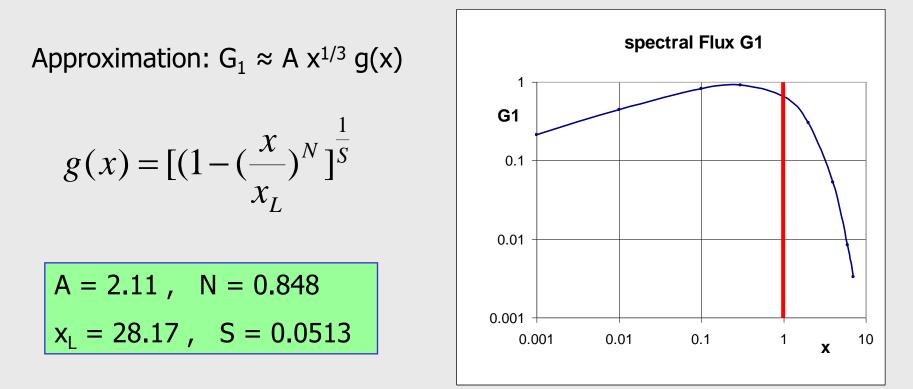

Wavelength continuously tunable !

A useful approximation

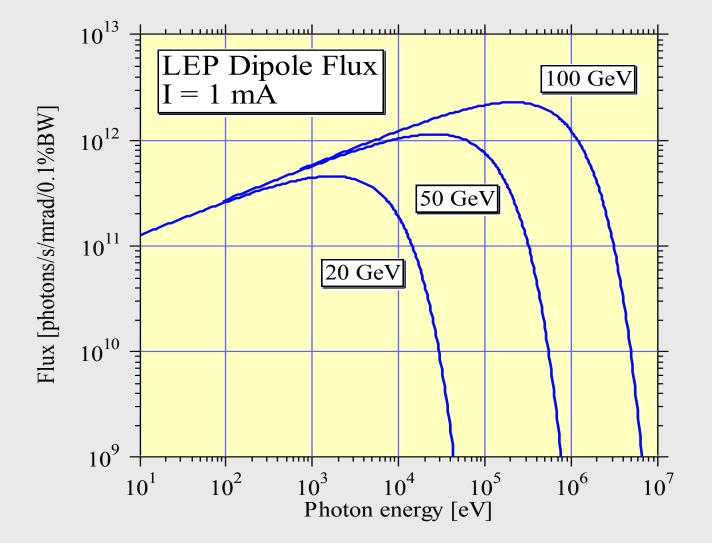

Spectral flux from a dipole magnet with field B

 $\operatorname{Flux}\left[\frac{\operatorname{photons}}{\operatorname{s} \cdot \operatorname{mrad} \cdot 0.1\% \mathrm{BW}}\right] = 2.46 \cdot 10^{13} \mathrm{E}[\mathrm{GeV}] \ \mathrm{I}[\mathrm{A}] \,\mathrm{G}_{\mathrm{I}}(\mathrm{x})$

Werner Joho, PSI

Synchrotron radiation flux for different electron energies

Angular divergence of radiation

The rms opening angle R'

at the critical frequency:

$$\omega = \omega_{\rm c} \qquad \mathbf{R'} \approx \frac{0.54}{\gamma}$$

well below

$$\omega \ll \omega_{\rm c} \qquad \mathbf{R'} \approx \frac{1}{\gamma} \left(\frac{\omega_{\rm c}}{\omega}\right)^{\frac{1}{3}} \approx 0.4 \left(\frac{\lambda}{\rho}\right)^{\frac{1}{3}}$$

independent of γ !

well above

$$\omega \gg \omega_{\rm c} \qquad \mathbf{R'} \approx \frac{0.6}{\gamma} \left(\frac{\omega_{\rm c}}{\omega}\right)^{\frac{1}{2}}$$

Electron in a storage ring:

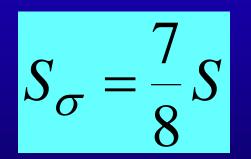

Polarisation

Synchrotron radiation observed in the plane of the particle orbit is horizontally polarized, i.e. the electric field vector is horizontal

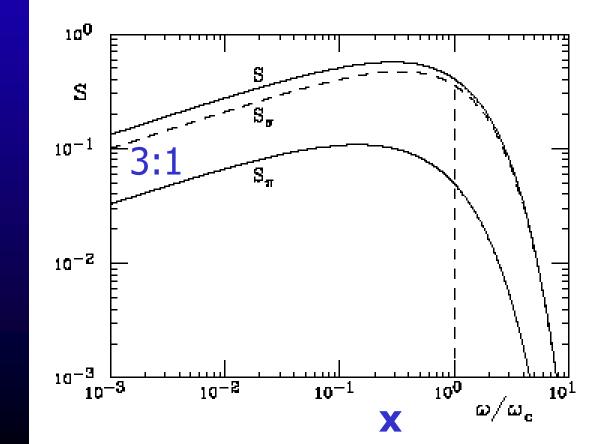

Observed out of the horizontal plane, the radiation is elli

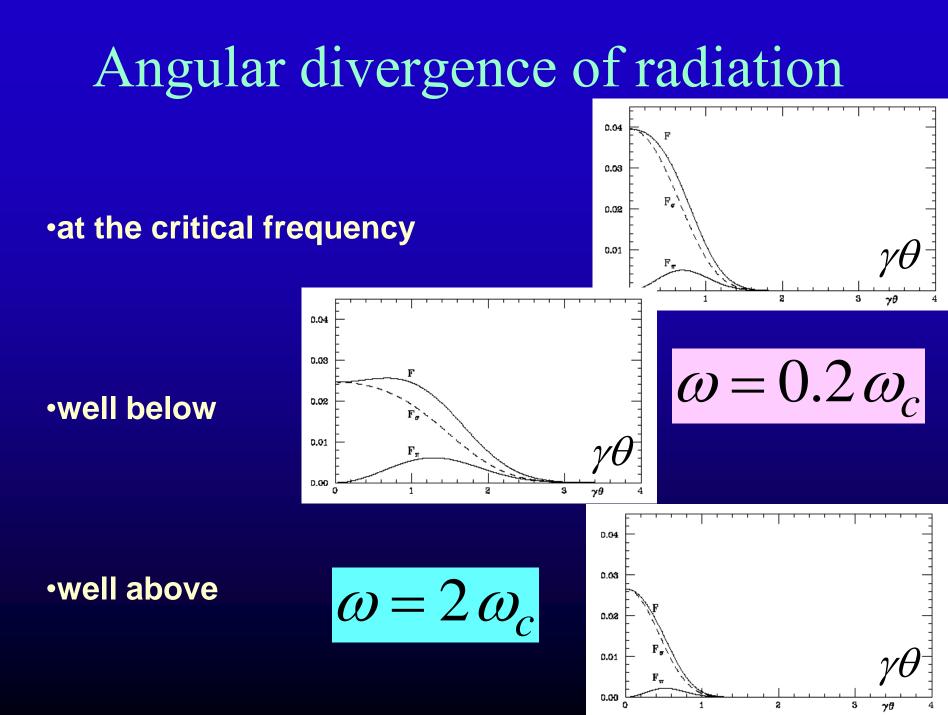

Polarisation: spectral distribution

$$\frac{dP}{d\omega} = \frac{P_{tot}}{\omega_c} S(x) = \frac{P_{tot}}{\omega_c} [S_{\sigma}(x) + S_{\pi}(x)]$$

 S_{π}
