

Beam Diagnostic Requirements Overview

Gero Kube

DESY (Hamburg)

- Measurement Principles
- Specific Diagnostics Needs for Hadron Accelerators
- Specific Diagnostics Needs for Electron Accelerators

HELMHOLTZ RESEARCH FOR
GRAND CHALLENGES

Reminder: Lepton Properties

● properties of electrons/positrons

- simple point objects
- small rest mass

$$m_e c^2 = 0.511 \text{ MeV}$$

● consequences

- particles are relativistic already at a few MeV
 - typically at first accelerating section
- particles produce strong electromagnetic field

Lorentz factor:

$$\gamma = E / m_e c^2$$

- long range of transverse non-propagating fields
- emission of synchrotron radiation (bend motion)

influence on particle dynamics
impact on beam diagnostics

...discussion in context with different accelerator types

non-propagating transverse el. field

Electron Collider

- Comments on Synchrotron Radiation
- Injector Chain
- Storage Ring

Tuusula (Finland), 2-15 June 2018

HELMHOLTZ RESEARCH FOR
GRAND CHALLENGES

Lepton Collider (Storage Ring)

BEBC II @ IHEP (Beijing)

1 - 2.1 GeV e^+/e^-

Super KEKB @ KEK (Tsukuba)

4 GeV e^+ / 7 GeV e^-

first collisions: 26th April 2018

LEP @ CERN

100 GeV e^+/e^-

HERA @ DESY
27.5 GeV $e^+(e^-)$ / 920 GeV p

● general comments on lepton colliders (storage rings)

- standard, normal conducting dipole magnets
 - sufficient to achieve final energies
- long injector chain with different beam properties
 - **relaxed requirements, particle dynamics with radiation**

SR Emission in circular Accelerators

emitted power

$$P_{\gamma}[\text{MW}] = 8.85 \times 10^{-2} \frac{E^4[\text{GeV}^4]}{\rho[\text{m}]} I[\text{A}]$$

➤ HERA e ($I=50$ mA, $E=27.5$ GeV, $\rho=550$ m): $P_{\gamma} = 4.6$ MW

protect accelerator components from
direct SR illumination !

power is real!

L.Rivkin (PSI), CAS 2004

damaged front end gate valve;
incident power about 1 kW for time
estimated to 2-10 min.

energy loss per turn

$$\Delta E[\text{keV}] = 88.5 \frac{E^4[\text{GeV}^4]}{\rho[\text{m}]}$$

➤ HERA e ($E=27.5$ GeV): $\Delta E = 92$ MeV

→ average radiated power restored by RF

cavity provides voltage to accelerate particles back to nominal energy

requires typically a large number of cavities

HERA e: 98 cavities, grouped in 8 sections;
8 transmitter stations, each with 1.4 MW
nominal power, fed by 2 Klystrons.

Consequences of SR Emission

● large number of cavities

- cavity represents *high impedance* → excitation of (multibunch) *instabilities*

need for feedback systems

● high SR power

- heat load critical

protection of machine and instrumentation, necessity of cooling

● high total cavity voltage V_r for loss compensation & lifetime

- rms bunch length

$$\sigma_t = \frac{\alpha_c - 1/\gamma^2}{2\pi f_s} \sigma_\delta \propto 1/\sqrt{V_r}$$

(above transition energy)

smaller bunch lengths → beam spectrum with higher frequencies

● beam emittance

- formation of *equilibrium emittances* in all 3 planes

→ *radiation damping* and *quantum fluctuations* (random excitation of oscillations)

emittance determined by storage ring itself

emittance blow-up not critical, relaxed requirements for injector chain

$e^\pm$ Injector Complex @ DESY

- **thermionic gun**
150 keV, 3 μ sec long pulses @ 50 Hz
- **chopper and collimator**
shortening of long gun pulses (60/20 nsec for e^+/e^-)
- **pre-buncher**
single cell cavity, matching to linac RF
- **Linac sections**
3 GHz (S-band) travelling wave structure, $f_{\text{rep}} = 50$ Hz
- **converter for e^+ production**
7 mm (2 rad. length) thick W target in 1.8 T solenoid field
- **Positron Intensity Accumulator (PIA)**
re-formation of time structure for synchrotrons ($\rightarrow$ 500 MHz)
two RF systems (10.4 MHz and 125 MHz)

Linac front-end

3 GHz Linac section

HELMHOLTZ
RESEARCH FOR
GRAND CHALLENGES

Injector Complex Instrumentation

● key devices for

- adjusting beam transport through injector sections
- tuning the RF system
- indicating operating status

● overview: standard instrumentation and their tasks

*in principle same than
for hadron machines*

➤ transfer efficiency

- current transformers

➤ beam position for beam steering

- screens (low energy deposition)
- BPMs (sensitivity for long linac bunch trains)

➤ beam profiles for beam optics matching

- scintillating/OTR screens (in straight section)
- synchrotron light (accumulator ring)

➤ transverse emittance

- multi-screen method or quadrupole scans (in straight section)
- synchrotron light (accumulator ring)

➤ longitudinal plane

- magnet spectrometer for energy (-spread) (diagnostics beamline)
- time structure via RF deflector, wall current monitor, coh. radiation diagnostics

Comment: e^+ Production

● principle of positron production

K.Hübner, Hyperfine Interactions 44 (1988) 167

➤ conversion target in harming radiation environment

→ only radiation resistive diagnostics close to target

➤ high e^+ yield: focus at converter

→ profile measurement close to target desirable

→ **secondary emission monitors** (no screens because of degradation)

➤ matching the energy acceptance ($\Delta E/E$) of accumulator ring

→ i) spread from conversion process, ii) microbunch length

→ **precise measurements of energy spread and bunch length**

conversion target @ DESY Linac II

C.Bourat et al., Proc. EPAC 94, p.704

Storage Ring Diagnostics: Remarks

● „walk“ along injector chain to storage ring / collider

- no fundamental difference in requirements compared to hadron machines
- no fundamental difference in instrumentation between e-linac and storage ring
 - *direct description of needs for storage ring diagnostics*

● diagnostics system of storage ring / collider

- | | | |
|---------------------------------|---|---|
| ➤ current monitors (AC and DC) | → bunch charge, stored dc current |  |
| ➤ BPMs | → orbit |  |
| ➤ tune measurement | → working point |  |
| ➤ feedback system | → stabilization |  |
| ➤ synchrotron light diagnostics | → beam profile, emittance |  |
| ➤ energy measurement | → cms energy for particle production |  |
| ➤ luminosity monitors | → collider key parameter, optimization
<i>simple point objects, i.e. absolute luminosity</i> |  |
| ➤ beam loss monitors | → control losses, optimization
<i>not only protection, also for machine physics</i> |  |
| ➤ machine protection system | → temperature control,...
<i>protection of sensitive components (heat load)</i> |  |

Storage Ring Diagnostics (1)

● beam position monitors (BPMs)

- short electron bunches (10 - 100 psec)
 - use of *button pickups*
- synchrotron radiation emission
 - pickups mounted *out of orbit plane*
- vacuum chamber profile not rotational-symmetric
 - *horizontal emittance* » *vertical emittance*
(SR emission in horizontal plane)
 - *injection oscillations due to off-axis injection*
(allows intensity accumulation)

correction of non-linearities
in beam position

Super KEBB

H. Fukuma (KEK),
Proc. eeFACT 2016,
WET1H3

HERA e

PEP II

Storage Ring Diagnostics (2)

tune

- radiation damping due to SR emission
 - permanent excitation, online tune control

HERA e
tune controller

courtesy: F.Sannibale (LBNL)

feedback

- long-range electromagnetic fields and short bunch lengths (→ broad beam spectrum)
 - fields act back on beam itself via environment
 - excitation of *coupled bunch instability*
- feedback system for instability damping
 - detection system to measure beam oscillations
 - signal processing unit to derive correction signal
 - broad band amplifier and beam deflector to act on beam

H. Fukuma (KEK), Proc. eeFACT 2016, WET1H3

Storage Ring Diagnostics (3)

HELMHOLTZ RESEARCH FOR GRAND CHALLENGES

transverse profile / emittance

- imaging with *synchrotron radiation* (SR)
 - non-destructive profile diagnostics
- HERA e beam sizes: $\sigma_h = 1200 \mu\text{m}$, $\sigma_v = 250 \mu\text{m}$
 - resolution with *optical SR* sufficient
- problem: *heat load* on *extraction mirror* (X-ray part of SR)
 - material with low absorption coefficient (Be)
 - cooling of extraction mirror
 - not sufficient to prevent image distortion...

$T_{\text{max}} = 1200^\circ\text{C}$

solutions:

HERA e:

observation out
of orbit plane

PEP II: slotted mirror

A.S.Fisher *et al.*, Proc. EPAC 1996, TUP098L

Storage Ring Diagnostics (4)

● longitudinal profile

➤ SR single particle time structure

→ calculation for 6 GeV electron,
electric field vector in orbit plane

time structure of SR suitable
to resolve *psec* longitudinal
profiles (and even less)

➤ streak camera

→ time resolution ~ 1 psec

courtesy: Hamamatsu

Storage Ring Diagnostics (5)

- **beam energy:** $e^\pm$ are point objects, i.e. reaction energy directly related to beam energy

fixed target
AGS (BNL)

J.J.Aubert et al., Phys. Rev. Lett. 33 (1974) 1404

- **Nobel Price**  (1976)

➤ discovery of J/Ψ for Samuel Ting & Burt Richter

- **measurement techniques**

➤ determination via dipole current not sufficient

→ **resonant depolarization** or **Compton backscattering**

J.-E.Augustin et al., Phys. Rev. Lett. 33 (1974) 1406

The CERN Accelerator School

3rd Generation Light Source

- Storage Ring based Light Source

Tuusula (Finland), 2-15 June 2018

HELMHOLTZ RESEARCH FOR
GRAND CHALLENGES

Storage Ring based Light Sources

● storage ring based 3rd generation light source

<http://www.diamond.ac.uk/AboutDiamond/Diamondstep-by-step/default.htm>

- storage ring: energy 1 – 8 GeV, circumference ca. 100 - 2300m
 - insertion devices integrated part of storage ring (straight sections)
 - user experiments at end of beamlines (~50-100m away from source)
- short injector chain
 - standard instrumentation

undulator:
Petra3 @ DESY

SOLEIL
2.75 GeV / C = 354 m

ESRF
6 GeV / C = 844 m

Light Sources: Remarks

● key parameter: spectral brilliance

- measure for phase space density of photon flux
- user requirement: high brilliance
 - lot of monochromatic photons on sample

➤ connection to machine parameters

$$B \propto \frac{N_\gamma}{\sigma_x \sigma_{x'} \sigma_y \sigma_{y'}} \propto \frac{I_{beam}}{\varepsilon_x \varepsilon_y}$$

➤ requirements for storage ring and diagnostics

i) high beam current

- achieve high currents
- cope with high heat load (stability)

stability is critical issue

$$B = \frac{\text{number of photons}}{[\text{sec}][\text{mm}^2][\text{mrad}^2][0.1\% \text{ bandwidth}]}$$

comparison:
2nd, 3rd and 4th generation
light sources

ii) small beam emittance

- achieve small emittance (task of lattice designer)
- measure small emittance
- preserve emittance (stability)

Light Sources: Stability

energy stability, suppression of energy widening effects

- cause: (long.) multibunch instabilities
- shift of radiation harmonics from undulator
 - intensity fluctuation, line broadening
- longitudinal **multibunch feedback systems (MBFS)**

Synchrotron Radiation

Sources – A Primer, ed. H.Winick

undulator radiation (3rd harmonic) @ ALS

intensity stability

- change in background conditions and thermal load on beamline and machine components
 - position stability!
- transverse multibunch instabilities → **transverse MBFS**
- operation in top-up mode (passive stabilization)
 - loss compensation by refill small amount of charges in short time intervals

vast dynamic range for instruments, starting from injector chain

stored current (1 week) @ Spring8

H.Tanaka et al., J. Synchrotron Rad. 13 (2006) 378

position stability

- intensity fluctuations, emittance dilution → reduction of brilliance
- orbit feedback systems** including **high resolution e-BPMs** and **photon-BPMs** in beamlines

Light Sources: BPMs

high resolution e-BPMs

- typical stability tolerance: **20% emittance growth**

$$\frac{\Delta\varepsilon}{\varepsilon} = 2 \frac{\Delta\sigma}{\sigma}$$

→ **10% of the (1σ) beam size**

→ example: **average** position stability at IDs for PETRA III @ DESY $\Delta\sigma_{hor} = 2 \mu m$, $\Delta\sigma_{vert} = 0.3 \mu m$

- typical example: **NSLS-II BPM chamber**

→ asymmetric chamber profiles

(pumping channel, avoid heat load, ...)

correction of strong position
non-linearities

S. Sharma et al., Proc. MEDSI-6 2011, DLS Proceedings Vol. 1 e63

photon BPM

- location in user beamlines: **two monitors (per plane)** → correction of position and angle

„blade“ type BPM

sensitive for tails
of distribution

courtesy: F.Sannibale (LBNL)

residual gas XBPM

sensitive also for
distribution core

courtesy: P.Ilinski (BNL)

Light Sources: Emittance Diagnostics (1)

- **emittance:** typical values $\epsilon_x = 1\text{-}5 \text{ nm}\cdot\text{rad}$ and 1% emittance coupling

- example: $\sigma_h = 40 \text{ }\mu\text{m}$, $\sigma_v = 20 \text{ }\mu\text{m}$ (PETRA III @ DESY)

fundamental resolution limit (uncertainty principle)

$$\Delta\sigma \approx \frac{\lambda}{2\Delta\Psi}$$

optical imaging @ PETRA: $\lambda = 500 \text{ nm}$ and $\Delta\Psi_v = 1.7 \text{ mrad}$

$\Delta\sigma_v = 145 \text{ }\mu\text{m}$

diffraction limited

- **imaging at smaller wavelengths:** *X-ray imaging with focusing optics*

- reflective optics

Kirkpatrick-Baez mirrors,...

- diffractive optics

Fresnel zone plates,...

- refractive optics

Compound Refractive Lenses (CRL)

CRL monitor @ ESRF (32 keV)

F. Ewald et al., Proc. IBIC 2013, Oxford, UK (2013) 833

X-ray imaging with non-focusing optics

- **pinhole camera**

example: Diamond Light Source

C. Thomas et al., Phys. Rev. ST Accel. Beams **13** (2010) 022805

Light Sources: Emittance Diagnostics (2)

HELMHOLTZ RESEARCH FOR GRAND CHALLENGES

● exploit coherence properties

➤ Synchrotron Radiation Interferometer (SRI)

T. Mitsuhashi, Proc. of BIW 2004 Knoxville, Tennessee, p.3

➤ example: SRI @ PETRA III

USR studies at PETRA III (DESY):

$\epsilon_x = 160 \text{ pm.rad}$ @ 3 GeV

● exploit Point Spread Function (PSF)

➤ π -polarization imaging

V. Schlott et al., Proc. IBIC 2013, Oxford, UK (2013) 519

widely applied @ SLS

● coded aperture imaging

R.H. Dicke, Astrophys. Journal 153, L101, (1968)

J.W. Flanagan et al., Proc. DIPAC 2011, Hamburg, Germany (2011) 561

C. Bloomer, „Coded Aperture @ DLS“, TUCZB2

The CERN Accelerator School

4th Generation Light Source

- Linac based Light Source
 - Free Electron Laser (FEL)

Tuusula (Finland), 2-15 June 2018

HELMHOLTZ RESEARCH FOR GRAND CHALLENGES

Free Electron Lasers (FELs)

- linac (single pass) based 4th generation light sources

Linac based Self Amplification of Spontaneous Emission (SASE) FELs

(→ no matter for diagnostics which FEL type)

Electron bunch modulated with its own synchrotron radiation field

- micro-bunching
- more and more electrons radiate in phase until saturation is reached

- beam energy defines photon

wavelength λ_r

$$\lambda_r = \frac{\lambda_u}{2\gamma^2} \left(1 + \frac{K^2}{2} \right)$$

λ_u : undulator period

K : undulator parameter (measure for B field)

Free Electron Lasers (FELs)

linac-based European X-ray FELs

FLASH @ DESY (Hamburg)

$E_{\max} = 1.25 \text{ GeV}$, $\lambda = 4 - 90 \text{ nm}$

SwissFEL @ PSI (Villigen)

$E_{\max} = 5.8 \text{ GeV}$, $\lambda = 0.1 - 5 \text{ nm}$

European XFEL @ XFEL GmbH/DESY (Hamburg)

$E_{\max} = 17.5 \text{ GeV}$, $\lambda = 0.05 - 4.7 \text{ nm}$

FERMI @ Elettra (Trieste)

$E_{\max} = 1.5 \text{ GeV}$, $\lambda = 4 - 65 \text{ nm}$

➡ seeded FEL (no SASE)

Th. Tschentscher *et al.*, Appl. Sci. **2017**, 7(6), 592

FEL Beam Properties (1)

- single or few bunches, typically with large separation

requires single bunch measurements

- high current density

- sufficient energy transfer from electron beam to radiation field
 - natural scale: **number of electrons per wavelength**

$$N_{e,\lambda} = \frac{I\lambda}{ec}$$

$$N_{e,\lambda} = 1 \Rightarrow I = \begin{cases} 0.5 \mu\text{A} & (\lambda = 100 \mu\text{m}) \\ 0.5 \text{ A} & (\lambda = 0.1 \text{ nm}) \end{cases}$$

requires additional bunch compression in order to increase current density

extremely short bunch lengths: 10-100 fsec

- charge per bunch: pCb up to about nCb

- new trend: short pulse operation, requires lower and lower charges...
 - **signal to noise problems** at low charge, even for kA peak currents
 - **high dynamic range** for diagnostic devices

FEL Beam Properties (2)

● high quality electron beam

➤ energy spread

$$\frac{\sigma_E}{E} \approx 10^{-4}$$

➤ transverse emittance

$$\varepsilon \leq \frac{\lambda}{4\pi}, \quad \varepsilon = \varepsilon_N / \beta\gamma$$

(→ high energy helps)

for resonant energy exchange and good overlap with radiation field

high demands on 6-dimensional phase space

➤ *longitudinal phase space*

- short bunches require complicate longitudinal diagnostics
- new methods required to verify pulse lengths of electron and laser bunch

➤ *transverse phase space*

- beam gets extremely small, often weird shape
- emittance is no equilibrium property, many effects can spoil it
- optics errors propagate through entire machine (linac is open loop system)
- coherent effects due to short pulses and instabilities

FEL Beam Properties (3)

comment: transverse emittance

- electrons *slip back in phase* with respect to photons by λ_r each undulator period
- FEL integrates over slippage length → **slice emittance** of importance

projected emittance

stability

- energy stability → wavelength stability
 - arrival time stability (**fsec**) → pump probe experiments
 - position stability
- overlap between beam and radiation in undulators

$$\frac{\Delta\lambda}{\lambda} = -2 \frac{\Delta E}{E}$$

LLRF feedback

high level synchronisation

high resolution BPMs, orbit feedback

example: XFEL @ DESY

- length of undulator section: 100-150 m
- BPM position resolution:

1 μm (single bunch), **100 nm** (average over bunch train)

FELs: Comments

linac-based FEL

- no radiation damping → beam quality determined already from the gun

careful diagnostics and control of beam parameters

SASE FEL is not forgiving – instead of reduced brightness, power nearly switches **OFF**

accelerating structures

- part of SASE FELs use superconducting RF cavities

part of diagnostics (BPMs) in cold vacuum
particle free environment

9 cell, 1.3 GHz Nb TESLA cavity

SASE FELs: FLASH and XFEL @ DESY

FEL Diagnostics: Overview

- standard electron beam diagnostics to operate the linac

 - instrumentation to measure**

 - electron beam orbit
 - bunch charge
 - beam size
 - beam phase
 - energy and energy spread

 - fast protection system to shut-off the beam in case of high losses**

 - prevent damage on undulator (demagnetization) and vacuum system (leakage)

- diagnostics needed to control and optimize the FEL

 - **beam size / transverse emittance**
→ OTR/wire-scanner stations, resolution $< 10 \mu\text{m}$
 - **bunch length / longitudinal profile**
→ bunch length $< 100 \text{ fsec}$, reconstruction of bunch shape
 - **slice emittance**
 - **bunch compression** → online signal for optimization of SASE process

- diagnostics needed for user experiments

 - characterization of radiation pulse (energy, spectral distribution)
 - synchronisation & stability (time-resolved experiments → fsec)

HELMHOLTZ

- stability

➤ beam size

- measurement
- non-invasive

https://www.linearcollider.org/pdf/ILC_Accelerator_bynumbers.pdf

ILC: Diagnostics

● beam position measurements with sub- μm resolution

- *Cavity BPMs* for higher resolution applications
- location in **cold** and **warm** sections
- variety of R&D activities for ILC BPMs at different laboratories
- **single bunch position resolution of $\sim 20\text{ nm}$** achieved at ATF (KEK)

courtesy: T.Nakamura (Tokio University)

high resolution cavity BPM for ILC final focusing system

● non-invasive beam profile monitors

➤ laser wire scanner

- scanning a finely focussed laser beam across bunches
- measure scattered photons (*inverse Compton scattering*) in downstream detector
- photon rate as function of relative laser beam position

beam profile

principle of laser wire scanner

ILC Reference Design Report (2007)

Outlook: New Accelerators

circular colliders

Future Circular Collider (FCC) @ CERN

Future Circular Collider
Circumference: 80-100 km
Energy: 100 TeV (pp)
>350 GeV (e⁺e⁻)

Large Hadron Collider
Circumference: 27 km
Energy: 14 TeV (pp)
209 GeV (e⁺e⁻)

Tevatron (closed)
Circumference: 6.2 km
Energy: 2 TeV

<https://fcc.web.cern.ch>

Circular e⁺e⁻ Collider (CEPC) @ China (Super pp Collider - SppC)

$E_{beam} = 120 \text{ GeV}$, $C = 54 \text{ km} / 100 \text{ km}$

light sources

circular: *Ultra Low Emittance Rings*

$$\varepsilon \propto \gamma^2 \theta^3$$

→ Multi Bend Achromat (MBA) scheme, i.e. small bend angle θ

➡ challenging for *emittance diagnostics*

linear: from *pulsed* to *cw* operation

low charge operation for *attosecond photon pulses*

}

challenging for *all diagnostics*

plasma wakefield acceleration, dielectric wakefield acceleration, ...

require new concepts for beam diagnostics
